1

Getting Started

Both Oracle Hospitality Integration Cloud Service users and OPERA Cloud Foundation users are authorized to access the Oracle Hospitality Integration Platform, the Oracle Hospitality Developer Portal, and Oracle Hospitality APIs.

Digital Learning Access

Oracle Hospitality Digital Learning content is available for Oracle Hospitality Integration Platform (OHIP). In Digital Learning under 'Learn about Oracle's Products,' you can choose from the following products:

- Oracle Hospitality OPERA Cloud
- Oracle Hospitality Reporting and Analytics
- NOR1 an Oracle Company
- Oracle Hospitality Integration Platform

After you select a product, different learning paths are available. For OHIP, there are two available Learning Paths:

- Oracle Hospitality Integration Platform (OHIP) Learning Path is designed for OPERA
 Cloud Foundation Customers who wish to access OHIP at their organization. The Oracle
 Hospitality Integration Platform (OHIP) Learning Path will provide an overview of the
 benefits, highlight features, and provide instruction on the fundamentals of OHIP.
- Oracle Hospitality Integration Platform (OHIP) for Integrators Learning Path is
 designed for Oracle Hospitality Integration Cloud Service Integrators (also known as
 Integration Partners) who wish to access OHIP. The Oracle Hospitality Integration
 Platform (OHIP) path will provide an overview of the benefits, highlight features, and
 provide instruction on the fundamentals of OHIP.

Getting Started for Partners (for Oracle Hospitality Integration Cloud Service Users)

There are two ways to onboard partners to the Oracle Hospitality Integration Cloud Service:

- Oracle Store You can onboard by purchasing the Oracle Hospitality Integration Cloud Service through the Oracle Store. Follow the procedure below to onboard through the Oracle store.
- Partner Registration Cost Price Quote (CPQ) form— If you are unable to onboard through the Oracle Store, you can onboard by submitting the partner registration (CPQ) form. You can request this form through email by contacting hospitality apis ww grp@oracle.com.

Oracle Store

To onboard through the Oracle Store:

Note:

You must have an Oracle account to proceed with the shopping cart checkout. To create a new Oracle account, go to the Oracle Store and click the **New user?** button and complete the form. After submitting the form, follow the instructions to check your email to verify your email address.

 Go to the Hospitality Integration Platform and click Shop now and then click Add to Cart.

Alternatively, go directly to the Oracle Shop and click Add to Cart.

- 2. Click your shopping cart to proceed to check out.
- Click Checkout.
- 4. Follow the instructions to complete your account details, additional information, service information, billing information, and payment method and agree to the terms and conditions of the Cloud Service Agreement.
- 5. Click Place Order.

To view and track your order, go to your Account Dashboard and click Orders.

After purchasing the Oracle Hospitality Integration Cloud Service, you will receive the following emails from either the Oracle Store or the CPQ process:

- The first email is a confirmation of your order and contains the order number for reference.
- A second email invites you to set up your Oracle Cloud Account. This email contains your order number.

Follow the below steps to create your Oracle Cloud Account by clicking the **Create Cloud Account** link in the email and providing the following details.

- 1. Cloud Account Name: A unique name for your Oracle Cloud Account.
- 2. **Email Address**: Enter your email address. This is the email address to which the emails in steps 3 and 4 will be sent.
- Enter the email address of the cloud account admin and service admin for your services. This admin user can create other administrators or users.
- A third email prompts you to confirm your Oracle Cloud Account.
- A fourth email confirms that your setup is complete. This includes the Oracle Cloud Console URL to enable you to perform Cloud Admin tasks as well as a Service Instance URL to the Oracle Hospitality Developer Portal. This URL conforms to the following format:

https://partner.hospitality-dev-portal.us-ashburn-1.ocs.oraclecloud.com/<Oracle Cloud Account Name>/ui/

If you have not received all the above emails within 24 hours of placing your order, please contact the Oracle customer service number referenced in the first email.

Digital Learning Access for Partners

Oracle Hospitality Integration Platform (OHIP) for Integrators Learning Path is designed for Integration Partners who wish to access OHIP. The Oracle Hospitality Integration Platform (OHIP) path provides an overview of the benefits and highlight features and provide instruction on the fundamentals of OHIP. To gain access, follow the instructions below:

For Partners who have purchased B92141 Oracle Hospitality Integration Cloud Service:

New Partners

- New partners as of 27-MAR-2023 will be sent a Digital Learning activation email once their order is received.
- The Digital Learning Activation email will be sent to the End User Contact that appears on the order.
- If an activation email is not received, email **operaenablement_ww@oracle.com** and include the following information:
 - Company Name (as it appears on the Order/Account)
 - Primary Contact Email

Existing Oracle Hospitality Integration Cloud Service Partners

If you have access to Oracle Hospitality Digital Learning, use the search filters on the Digital Learning Platform to find your desired OHIP content.

If you do not have access, follow these instructions:

- Email operaenablement_ww@oracle.com and include the following information:
 - Company Name (as it appears on the Order/Account)
 - Address (include Country)
 - Primary Contact Name
 - Primary Contact Email
 - Approximate Purchase Date (that is, the approximate date Oracle Hospitality Integration Cloud Service was purchased)

Once this information is received, the Digital Learning team will verify the information. Please allow five business days for responses.

Oracle Hospitality Open Forum

Oracle Hospitality Open Forum hosted within Slack is an inclusive platform designed to bring together individuals who share a passion for our industry. This vibrant community aims to foster collaboration, knowledge sharing, and networking opportunities, allowing members to connect, learn, and grow together.

The decision to create this open community was driven by several important reasons:

- Collaboration and Knowledge Sharing: By launching this open forum, we aim to
 encourage collaboration and knowledge sharing among Vendors, SIs, and Oracle
 Hospitality. It provides a dedicated space for members to ask questions, seek
 advice, and engage in thought-provoking discussions, leading to mutual growth
 and learning.
- Networking and Relationship Building: The Slack open community offers a
 platform for individuals to network and form valuable connections. This enables
 the establishment of relationships that can potentially lead to partnerships,
 mentorships, and career opportunities.
- Inclusivity and Diversity: The open community promotes inclusivity and diversity
 by bringing together individuals from various backgrounds and experiences. It
 fosters the exchange of diverse perspectives and creates an environment of
 understanding and empathy.
- Maturity of the OHIP Platform and a growing number of enabled platform components.

To facilitate effective communication and organization, we have structured the open community as follows:

Channels

- 01_announcements: This channel (managed by Oracle Hospitality) is used to share insightful updates on our products, maintenance, and important reminders with the partner community.
- 2. 02_open_forum: The open forum channel enables partners, SIs, and other community members to interact directly with each other. Oracle will moderate this channel, and we kindly request all participants to adhere to etiquette rules to maintain a collaborative approach.

Additional Benefits

Note the following additional benefits:

- New partners who join OHIP will be granted access to a Private Channel during the first 30 days after joining OHIP. This channel will assist you with your initial development efforts.
- Existing partner private channels will be archived after 30 days from the open forum launch, with the exception outlined below.

Partners who meet the following criteria will remain eligible for private channel communication with Oracle Hospitality:

- Active OPN Membership
- Published Oracle Hospitality Marketplace Listing
- At least one customer in Production via OHIP

Forum Etiquette

Here are some of the guidelines when interacting in the open community:

 Refrain from sharing personal or sensitive information, including usernames, passwords, and personally identifiable information (PII).

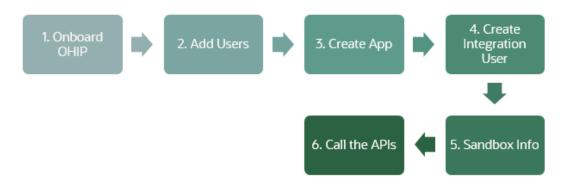

- Avoid the sharing of payment card information (PCI data) to prevent fraud or unauthorized access.
- Maintain respectful and considerate communication, avoiding harassment, discrimination, or hate speech.
- Actively participate and engage in the community by sharing expertise, asking questions, and contributing to discussions.
- Adhere to these guidelines to create a vibrant and secure space for collaboration and learning in the community.

Channel Access

You will automatically be granted access to the channels as you onboard OHIP. Please allow a few days after joining for your invitation to join.

Quick Start for Partners (Using the Partner Sandbox)

- 1. Onboard to OHIP via the Oracle Store.
- 2. Add users to the Developer Portal.
- 3. Sign in to the Developer Portal and register an application.
- 4. Create an integration user.
- 5. Obtain the credentials and gateway for the partner sandbox. The hotelld is SAND01.
- 6. Call the APIs.

If you need additional consulting to get you started, you can purchase it in groups of 2 hours. Visit the Oracle Store for more information.

Adding Developer Portal Users

To add or manage Portal users, you must have the Cloud Account Administrator or Service Administrator user role, your activated Oracle Cloud account, and your Oracle Cloud Console URL. For more information on how to onboard or provision an Oracle Cloud account, please refer to Getting Started for Partners.

The Oracle Cloud Console is customizable and can present different views to users depending on how it is set up.

The Account Administrator and Service Administrator users can add new users from the My Oracle Services screen in the Oracle Cloud Console.

Developer Portal users do not have access to call APIs.

Follow this process to create Developer Portal users:

- 1. Log in to your Oracle Cloud Account using your Oracle Cloud Console URL.
- On the User Assignments screen, click Users.
- 3. On the Users screen, click + Add.
 - On the Add User screen, enter the user details First Name, Last Name, Email, and User Name.

The new user account is created.

Assigning Users to Roles

After adding a new user, you can assign the **ApplicationDeveloper** role to the user, which gives them access to the Oracle Hospitality Developer Portal.

- Select the Application Developer Portal Role (under Hospitality Developer Portal).
- 2. Click Finish.

Signing In to the Oracle Hospitality Developer Portal

Sign in to the Oracle Hospitality Developer Portal to create applications, discover available Oracle Hospitality APIs, and register Oracle Hospitality APIs to your applications.

Open the Oracle Hospitality Developer Portal in a browser to the URL provided.

- 2. Enter your username and password.
- 3. Click Sign In.

Your account locks if you enter an incorrect username or password three times. For help getting back in to your account, click **Can't sign in** and the follow instructions on the screen.

Signing Out of the Oracle Hospitality Developer Portal

You can sign out of the Oracle Hospitality Developer Portal using the User menu.

- 1. On the Oracle Hospitality Developer Portal, click the user menu drop-down.
- 2. Click Sign Out.

Changing Your Password

Note:

These instructions for changing your password apply to those who onboarded through the Oracle Hospitality Integration Cloud Service.

If you onboarded through Oracle Hospitality OPERA Cloud Foundation/OPERA Cloud Services, refer to Changing Your Password in the *Onboarding Customers* section.

To change your password:

- 1. Sign in to the Oracle Hospitality Developer Portal.
- 2. On the user drop down menu, click My Profile.
- 3. Click the Change My Password tab:
 - a. Enter your Old Password.
 - b. Enter the New Password.
 - c. After all password criteria are met, enter the new password to confirm, and then click Submit.

Getting Started for Hoteliers (for Oracle Hospitality OPERA Cloud Foundation Users)

Oracle Hospitality OPERA Cloud Foundation includes access to the Oracle Hospitality Integration Platform.

Upon provisioning of or migration to Oracle Hospitality OPERA Cloud Foundation, you will receive an email advising you of the Oracle Hospitality Developer Portal URL.

For production OPERA environments, it will follow this URL format:

 https://customer.hospitality-dev-portal.us-ashburn-1.ocs.oraclecloud.com/ ashburn/ui/

or

 https://customer.hospitality-dev-portal.us-ashburn-1.ocs.oraclecloud.com/ frankfurt/ui/

For non production OPERA environments, it will follow one of these URL formats:

- https://customer.hospitality-dev-portal.us-ashburn-1.ocs.oraclecloud.com/ ashburnuat/ui/
- https://customer.hospitality-dev-portal.us-ashburn-1.ocs.oraclecloud.com/ ashburnuat02/ui
- https://customer.hospitality-dev-portal.us-ashburn-1.ocs.oraclecloud.com/ frankfurtuat/ui/

Digital Learning Access for Customers

Oracle Hospitality Integration Platform (OHIP) Learning Path is designed for OPERA Cloud Foundation Customers who want to access OHIP at their organization. The Oracle Hospitality Integration Platform (OHIP) Learning Path provides an overview of the benefits and highlight features and provides instruction on the fundamentals of OHIP.

New Customers

For Customers with Oracle Hospitality OPERA Cloud Foundation (Hotel/Resorts/Reseller), follow these instructions to access Digital Learning:

- The Digital Learning Activation email will be sent to the End User Contact that appears on the customer's order.
- If an activation email is not received, email **operaenablement_ww@oracle.com** and include the following information:
 - Customer Name (as it appears on their Order/Account)
 - Primary Contact Email

Existing Customers

If you have access to Oracle Hospitality Digital Learning, use the search filters on the Digital Learning Platform to find your desired OHIP content.

If you do not have access, but have OPERA Cloud Foundation, follow these instructions:

- Email operaenablement_ww@oracle.com and include the following information:
 - Customer Name (as it appears on the customer's Oracle account)
 - Address (include Country)
 - Primary Contact Name
 - Primary Contact Email

Once this information is received, the Digital Learning team will verify the information. Please allow five business days for responses.

Quick Start for Hoteliers (in UAT Environment)

Prerequisites

OPERA Cloud Foundation SKU

The hotel must purchase an OPERA Cloud Foundation SKU.

OHIP is not available for hotels using a legacy OPERA Cloud SKU.

Onboarded in OHIP

 The chain containing properties that are on OPERA Cloud Foundation must be onboarded with OHIP.

Oracle Cloud Infrastructure

 The onboarded chain and properties must be on Oracle Cloud Infrastructure (OCI) and NOT in a legacy data Centre.

Making API Calls

An OPERA Cloud chain administrator must create the DEVELOPERPORTALACCESS role via Oracle Identity Management (OIM) for both UAT and PRODUCTION.

- Assign the DEVELOPERPORTALACCESS role to all OPERA Cloud users requiring access to the OHIP Developer Portal. This will support Single-Sign On (SSO) with OPERA Cloud. See Getting Started for more information.
 - UAT: Refer to your Welcome email for this URL.
 - PROD: Refer to your Welcome email for this URL.
- Create a new integration user via Self Service using the UAT and PROD URLs. Refer to your Welcome email for these URLs. Once a request is submitted, the OPERA Cloud chain administrator must approve it. See Using the Oracle Hospitality APIs for more information.
- 3. Access the Developer Portal for UAT or PROD (using the URLs from your Welcome email) and click the **Environment** tab.
- 4. Click the environment card and to copy the client Id and secret. See Using the Oracle Hospitality APIs for more information.

Getting Started for Hoteliers (for Oracle Hospitality OPERA Cloud Foundation Users)

- 5. Register a new application in the **Applications** tab of the OHIP Developer Portal. When creating a new application, subscribe the application to all the APIs that appear. See Register and Manage Applications for more information.
- 6. Enter the hotel ID from which you want to get data. This is not the same ID as the chain admin and should be the ID of a specific hotel.

If you need to call early adopter (v0) APIs, send an email to hospitality_apis_ww_grp@oracle.com requesting to join the early adopter programme. You must reply to the email accepting the terms and conditions of the programme before access is provided.

Configuring Postman

- 1. Obtain the postman collections via the following:
 - Cloning our github repo and then importing the collections / environment under the postman-collections folder.
 - Forking our public postman workspace directly.
- 2. Set up a postman environment (one for UAT and one for PROD) with the previously obtained information plus the gateway URL:
 - **a. HostName**: API gateway URLs for UAT and PROD. Refer to your Welcome email for these URLs.
 - **b. Username**: Integration username previously obtained for UAT or PROD.
 - c. Password: Integration password previously obtained for UAT or PROD.
 - d. CLIENT_ID: Client ID previously obtained from the Developer Portal for UAT or PROD.
 - CLIENT_SECRET: Client ID previously obtained from the Developer Portal for UAT or PRO.
 - f. AppKey: The application key previously obtained .
 - **g. HotelId**: Hotel ID against which you want to perform actions. For example, obtaining reservation data.
- 3. Once all environments have been configured, select the **Get OAuth Token** collection and make a call.

If everything is set up correctly, OHIP responds with a HTTP 200 OK response, which includes the OAuth token.

Now you can try out other collections as required.

Creating the Developer Portal Access Role

This procedure is for a user with Chain Admin access in SSD-OIM to create an OHIP Developer Portal role for the corresponding OPERA instance. The role name is DEVELOPERPORTALACCESS.

When creating the role, ensure the role is assigned to the correct chain code.

Once the role is created, you can assign it to users so they can access the OHIP Developer Portal with the URLs specified in Getting Started for Hoteliers.

To add the DEVELOPERPORTALACCESS role

1. Navigate to and log in to the Oracle Identity Self Service portal.

This step must be performed by a Chain Administrator because OHIP only supports CHAIN level access.

The Oracle Identity Self Service URL is listed in the Welcome Letter received by your designated OPERA Property Administrator.

- 2. Click the Manage button.
- 3. Click the Roles tile and then click the Create link.
- 4. Enter the following required information into the General Role section:
 - Name. Enter the Chain Organization name followed by DEVELOPERPORTALACCESS. For example, PARCHN01-DEVELOPERPORTALACCESS.
 - **b. Display Name**. Reenter the same name as above.

The **Owned By** field will automatically populate based on who created the role.

- 5. The Hierarchy, Access Policy, and Members steps are not required. Click the **Next** to arrive on the Organization step.
- 6. Click the Add Chain Organizations button.
- Search for the Chain Organization name and click the Add Selected button to add the role.
- 8. Click the Select button.
- 9. Verify the DEVELOPERPORTALACCESS and then click **Next**.
- **10.** Verify the information you entered and then click the **Finish** button.

Adding Developer Portal Users

To access the Developer Portal, a hotel administrator assigns the DEVELOPERPORTALACCESS role to a chain org-level user in the Oracle Hospitality Shared Security Domain. For the steps to create this role, see Creating the Developer Portal Access Role.

Note:

Users assigned to this role must belong to the same organization specified in Creating the Developer Portal Access Role. Further, users must be chain org-level users to be granted the DEVELOPERPORTALACCESS role and to successfully access the Developer Portal.

Note:

Developer Portal users do not have access to call APIs.

For details on how to manage users in the Oracle Hospitality Shared Security Domain, refer to the Customer Support Portal document:

Oracle Hospitality Shared Security Domain (SSD) for OPERA

Signing In to the Oracle Hospitality Developer Portal

Sign in to the Oracle Hospitality Developer Portal to create applications, discover available Oracle Hospitality APIs, and register Oracle Hospitality APIs to your applications.

- 1. Open the Oracle Hospitality Developer Portal in a browser to the URL provided.
- Enter your username and password.
- Click Sign In.

Note:

Your account locks if you enter an incorrect username or password three times. For help getting back in to your account, click **Can't sign in** and the follow instructions on the screen.

Signing Out of the Oracle Hospitality Developer Portal

You can sign out of the Oracle Hospitality Developer Portal using the User menu.

- 1. On the Oracle Hospitality Developer Portal, click the user menu drop-down.
- 2. Click Sign Out.

Changing Your Password

These instructions for changing your password apply to those who onboarded through the Oracle Hospitality OPERA Cloud Foundation.

If you onboarded through the Oracle Hospitality Integration Cloud Service, refer to Changing Your Password in the Onboarding Partners - Oracle Hospitality Integration Cloud Service section.

To change your password:

- 1. Sign in to the Oracle Hospitality Developer Portal.
- On the user drop down menu, click My Profile. A new browser tab opens for Oracle Identity Manager (OIM).
- Click the My Information tile.
- In the Change Password section, enter your Old Password, enter your New Password, and reenter your new password in the Confirm New Password field.
- Click Apply. After a password change, a confirmation message shows that your password was successfully updated.

2

Discover and Subscribe to Oracle Hospitality APIs

Learn how to discover and subscribe to Oracle Hospitality APIs for your applications in the Oracle Hospitality Developer Portal.

API Search Engine

The API Search Engine enables you to filter by modules, workflows, lifecycle, and method. You can also search by free text to find an API or operation that meets your business case. Search results include operation level details from which you can access links to the API documentation and the Postman sample.

The table below lists all of the filters available on the left side of the page. Select from these filters to refine your API search results. The API search results appear in the center of the page in the form of API display cards.

Table 2-1 Side Filters

Filter	Description
Content	Search by API module or workflow. A workflow is a sample list of operations a user would perform for a specific scenario, such as creating a new block or performing a check-in.
API Lifecycle	APIs can be V0, V1, or Deprecated. V0 are described in the Discover and Subscribe to Oracle Hospitality APIs chapter.
	V1 are production ready and guaranteed for backward compatibility.
	Deprecated are no longer recommended for use. You should plan to cease using these and move to a V0/V1 equivalent operation.
API Category	The APIs are split into categories relevant to different Oracle Hospitality products. For example, Property are the APIs for OPERA Cloud, and Distribution are the APIs for the distribution platform.
API Module	Within a category, there are many APIs divided into modules and each module contains many operations. Filter by Module to narrow your search or leave this blank to view all the available modules.
API Workflow	API workflows are a collection of many different API call samples showing steps on how to perform functional workflows (for example, digital check-in and checkout).

Table 2-1 (Cont.) Side Filters

Filter	Description
Method	Filter by the following REST API Methods:
	Get : Retrieve information about the REST API resource.
	Post: Create a REST API resource.
	Put: Update a Rest API resource.
	Delete : Delete a REST API resource or related component.
	Head : Similar to a get, but the server does not return a response body. This method determines if a resource exists and is currently used for Property Asynchronous APIs.

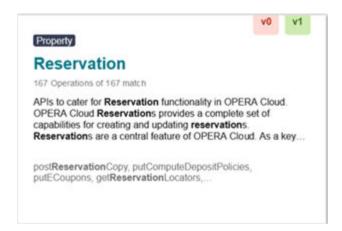

The number in brackets next to an API indicates the number of operations within it.

API Display Cards

API cards appear based on the search criteria you enter. If the search field is left blank, all API cards appear in alphabetical order.

Figure 2-1 API Display Card Example

The API Display Card displays the below information.

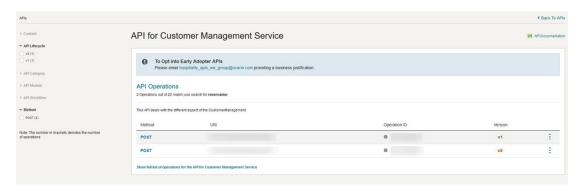

Table 2-2 API Display Card Fields

Field	Description
Property	This icon shows the category to which this API belongs. For example, Property are the APIs for OPERA Cloud, and Distribution are the APIs for Oracle Hospitality Distribution.
API Module Name	The name of the module. For example Reservation, Blocks, Cashiering, Reservations, and so on.
V0 / V1	V0 and V1 flags represent the operation level versioning in the API. If both flags are shown, it indicates that some operations are V1 and some are V0 within the module.
Number of Operations	Depending on your search, the API card will display the number of operations matching your search. If the search is left blank, the API card will show the total number of operations in that specific API.
Summary of the API	A short description of the API.
Operations that match your search	If you search a specific phrase or word and it matches the operations, the operations are highlighted on the card to provide a preview of the results displayed on the next page.

API Page

Once you click an API display card, the page for the API appears and shows more details about the operations within that API.

Figure 2-2 Example of an API Page — API for Customer Management Service

The API page shows the following details for the operations:

Table 2-3 API Page Details

Field	Description
API Documentation	Click this link to view the API documentation.
Information button	Click the button to view a short description of this operation.
Method	The type of API method, such as POST, GET, PUT, DELETE, and so on.
URI	The URI path for this operation. The URI is depreciated if it has a strike through.
Operation ID	The ID for the API operation.
Version	The API version, which is either v0 or v1.
Vertical ellipsis	Click to access links to the API documentation and the Postman sample.
Show full list link	Click the link below the table to view a complete list of operations for the API.

Viewing Oracle Hospitality APIs

The Oracle Hospitality Developer Portal's APIs page provides information about Oracle Hospitality APIs. Here you can find and evaluate Oracle Hospitality APIs to use with your applications.

- Click the API Documentation link to view the embedded documentation for the APIs.
- 2. On the left and middle panels, you can view all the available API resources and view an explanation for each field in both the request and the response. In the search field, you can enter the full name or partial name of a resource to further filter the results.
- 3. The right panel shows example requests and responses.

Early Adopter API Program

The Early Adopter API Program offers program members early access to newly released "version 0" APIs. In your Developer Portal, these APIs are in a separate Early Adopter section, and you can discover and subscribe to these APIs within your registered application.

In this release of Oracle Hospitality Integration Cloud Service, Oracle is elevating the benefits of the Early Adopter program. Members of the program benefit from the following:

- Early access to all 3K+ API operations released (also known as "version 0" APIs).
- Best endeavors assistance provided by Oracle Hospitality Integration Cloud Service product management.
- The ability to provide feedback that can potentially influence the product roadmap.

Note:

Please keep to in mind that some of the (v.0) API capabilities offered as part of the early adopter program may be less stable than Production APIs and can experience some difficulties. Furthermore, our aim is to avoid breaking changes in v.0 APIs, however we cannot guarantee full backward compatibility as we roll out patches to improve functionality and/or usability of our early adopter APIs.

Also note that the best endeavors assistance provided by product management as part of the program is not subject to service level agreements (SLAs); however, we do offer a premium (paid) service for partners and/or customers who desire dedicated support. Please contact hospitality_apis_ww_grp@oracle.com if this is of interest.

As an early API adopter, we look forward to your active insight and feedback as we refine and improve these API capabilities together.

Eligibility for the Early Adopter Program

Anyone who has access to the Oracle Hospitality Integration Platform is eligible to opt in to the Early Adopters Program. However, we have the following expectations from those that do opt in:

- Provide ongoing feedback that can help us improve the APIs.
- Share examples of API calls that worked or didn't work.
- When experiencing issues, provide context that can help us replicate the issue and also understand the business criticality. This information will help us prioritize accordingly.
- Be a bit patient as some of the APIs may be a little bumpy around the edges.

We're open to any feedback but ask that you please maintain a constructive tone. You can opt out at any time if this program is not for you.

How to Opt In to the Early Adopter Program

Opting in is easy. Just send an email to hospitality_apis_ww_grp@oracle.com and include the following information:

- use case(s)
- · desired timelines
- why you think our early adopter APIs will help you be successful
- whether you want to opt in to use Property or Distribution early adopter APIs

Joining the Early Adopter Program

- Onboard OHIP and try out the v1 APIs. For partners, follow the steps in Quick Start for Partners (Using the Partner Sandbox). For customers, see Getting Started for Hoteliers.
- Review the Early Adopter API Program, review the APIs in the program, and review the program eligibility and program expectations.
- 3. Email us at hospitatliy_apis_ww_grp@oracle.com to request access. In the email, state your use case(s), deadline timelines, and why you think our early adopter APIs will help you. For more information, see How to Opt In to the Early Adopter Program.

If you meet the eligibility criteria, Oracle will grant you access to the Early Adopter program.

- 4. Sign in to the Developer Portal.
- Register or edit an application. At step 10, on the subscription panel, select the Hospitality APIs tab and then select the check box. Next, select the Early Adopter tab and then select the check box.
- 6. Call the APIs.

If you need additional consulting to get you started, you can purchase it in groups of 2 hours. Visit the Oracle Store for more information.

How to provide Early Adopter Program feedback

We anticipate our early adopters to be very active in the development of integrations using our APIs and providing feedback and insight that can help improve and refine our product.

Send an email to hospitality_apis_ww_grp@oracle.com with the following information:

- Ease of use.
- Insights as to what improvements or refinements to make.
- · Successful or unsuccessful examples.

Early Adopter Property APIs

The following APIs are available for customers or partners who join the Early Adopter APIs program:

- Block Outbound API: provides operations for OPERA Cloud to access blocks from an external interfaces. It also offers the capability to download external blocks into OPERA Cloud.
- Accounts Receivables API: caters for Accounts Receivables functionality in OPERA Cloud. The OPERA Cloud Accounts Receivable module enables you to manage debtors' accounts, invoices, and remittance.
- Activity API: caters for Sales Activity functionality in OPERA Cloud. Activities provide
 you with an account management tool for managing daily tasks such as appointments,
 sales calls, contact follow-up, and so on.
- **Activity Management API**: caters for Activity Configuration functionality in OPERA Cloud. In this module you can retrieve, create, update Activity configuration codes; for example create a new Activity Type.
- Block API: caters for Business Block functionality in OPERA Cloud. A block is a group of rooms held for guests who are attending an event, meeting, or function. You can create blocks for family reunions, business conferences, weddings, and so on. You can also set aside rooms for the event (block).
- Block Configuration API: caters for Business Block configuration functionality in OPERA Cloud.
- Cashiering API: caters for Cashiering related functionality in OPERA Cloud. Cashiering
 provides access to a guest folio, posting journals, receipt histories, currency calculations,
 credit card settlements, and check a guest out.
- Channel Configuration API: caters for Channel Management functionality in OPERA
 Cloud. Channel Management allows a property to configure and administer channels
 such as OTAs, and web channels, covering functionality such as channel configuration,
 availability, inventory and restrictions.
- Customer Management Service API: caters for Customer Management Service, such as Track-it items.
- Customer Relationship Management (CRM) API: caters for Customer Relationship Management (profile) functionality in OPERA Cloud. There are different types of profiles in OPERA Cloud, including Guest, Company, Travel Agent, Source, Group, and Contact profile types. A profile can store and display a wide range of information about the guest, company, travel agent etc., depending upon the type of profile. For example, a guest profile can store the guest name, address, contact information, details on billing, membership benefits, preferences and much more. All profiles in OPERA when created are assigned a ProfileID. This ID will be used throughout the CRM APIs.
- Customer Relationship Management (CRM) Master Data Management API: caters for Customer Relationship Management (profile) configuration as well as Membership Configuration.
- **Data Value Mapping API**: The Data Value Mapping module offers capability to convert OPERA Cloud values to an external system's values or vice versa.
- Enterprise Configuration API: caters for Enterprise related functionality in OPERA.
- Enterprise Room Configuration API: caters for Room Configuration functionality in OPERA Cloud.
- (Sales) Event Management API: caters for Event Management functionality in OPERA Cloud. The Events feature in OPERA Cloud is designed to manage any kind of catering activity. Events can be as simple as a one-hour reception or more complex, such as a three-day business meeting with meals, breaks, and specific meeting room with setup and resource requirements. Any group function can be an Event.

- **Event Management Configuration API**: caters for Configuration functionality for Event Management in OPERA.
- **Export Master Data Management API**: caters for managing export master data configuration.
- Front Desk Master Data Management API: caters for Master Data Configuration for Front Office Operations in OPERA Cloud.
- Front Desk Operations Service API: caters for Front Desk Operations and Front Desk Statistic functionality in OPERA Cloud. Front Desk features some of the most commonly used operations in OPERA Cloud, such as managing guest arrivals, managing in-house guests, and managing guest departures. Some additional tasks you can complete from the Front Desk menu are room searches, room assignments, and quick check outs as well as opening folios, creating registration cards, setting wake up calls, and sending messages to guests.
- Housekeeping Service API: caters for Housekeeping functionality in OPERA
 Cloud. Housekeeping enables you to schedule daily room cleaning, maintenance,
 and housekeeping staff activities. It provides information on room status, out of
 order/out of service rooms, and forecasting.
- Integration Configuration API: caters for managing master data configuration in a hotel.
- Integration Processor API: caters for getting Business Events generated in OPERA Cloud.
- **Inventory API**: caters for Inventory functionality in OPERA Cloud. This includes sell limits for date ranges, viewing and updating the properties inventory, as well as item inventory (such as rollaways, microwaves, and so on).
- Leisure Management API: caters for external Leisure Management functionality integrated with OPERA Cloud.
- Price Availability Rate API: caters for Price and Rate Availability functionality in OPERA Cloud. Availability enables you to manage your room inventory by providing a detailed view of all available and sold rooms at a property. Some of the tasks you can perform include defining conditions for stay restrictions, setting room sell limits, and searching for and viewing room availability.
- Rate API: caters for Rate Availability functionality in OPERA Cloud. Rate
 Management provides all the tools you need to effectively define and manage the
 rate structures for a property in OPERA Cloud. Some of the things you can do
 include creating and managing rate codes, rate classes, rate categories, display
 sets, rate strategies, as well as managing promotion groups and codes.
- Reservation API: caters for Reservation functionality in OPERA Cloud. OPERA Cloud Reservations provides a complete set of capabilities for creating and updating reservations. Reservations are a central feature of OPERA Cloud. As a key source of information, the reservation specifies a guest's arrival date, departure date, room type, rate, packages, and many other details. It is also a gateway to dozens of other functions that contribute to the guest's experience. All reservations in OPERA Cloud require a guest profile. You can create profiles while booking a reservation. If a profile already exists, you can look it up (using getProfiles in CRM module) and attach it to the reservation during the reservation booking process using the Profile ID.
- Reservation Master Data Management API: caters for Reservation Configuration in OPERA Cloud. In this module you can retrieve, create, modify or delete configuration related to Reservations, Blocks and Leisure Management.

- Reservation Outbound API: APIs to cater for Reservation External (outbound) functionality in OPERA Cloud. The Reservation External module provides operations from OPERA Cloud to external interfaces.
- Room Rotation Configuration Service API: Room Rotation configuration provides room ownership configuration operations for automatic inventory rotation and prioritization for owner rooms assignment and occupancy.
- **System Monitoring API**: for System Monitoring related functionality in a hotel, including ADS error messages and Business event queue monitoring.

Nor1 Integrated Upsell APIs

The following Nor1 Integrated Upsell API is available:

• **Nor1 Upgrade**: An upsell service that can be consumed to display upgrade offers to a hotel guest prior to arrival. Pre-arrival upsells are becoming increasingly important due to the adoption of mobile and kiosk check-in, which reduces the opportunity for front-desk upselling. Upgrade offers are based on PRIME® AI/ML decision intelligence and OPERA real-time inventory. The service allows instant fulfillment of the upgrade offer.

Register and Manage Applications

Learn how to register and manage applications using the Oracle Developer Portal.

Registering an Application

Register new applications from the Applications page.

- 1. In the Oracle Hospitality Developer Portal, click the **Applications** tab.
- 2. Click Register Application.
- 3. On the Register Details panel, enter the application name and an optional description.
- 4. Enter the **Application Name** that applies to your application.
- 5. Optionally, add a Description for the application.
- 6. Optionally, select the Application Type.
- 7. Select the environment: **Non Production** or **Production**. An application can be either a non production application or a production application.
 - Non Production: By default, an application has access only to non production
 environments. A non production application may not access production
 environments, so to move from calling non production to calling production
 environments, you must create a new production application. To access production
 environments, please email your Oracle Partner Network (OPN) reference number to
 hgbu_integrations_provisioning_grp@oracle.com.
 - Production: Production refers to Oracle Hospitality APIs that can access Oracle
 Hospitality systems such as a production Oracle Hospitality OPERA Cloud Services
 environment. A production application may not access non production environments.
- 8. In the **Contact Information** section, enter your First Name, Last Name, and Email Address. Entering Phone Number and Company Name is optional.
- 9. Click Next.
- **10.** On the Subscriptions panel, select the group of Oracle Hospitality APIs to which you want to subscribe this application and then select the **Subscribe** check box.

ONLY subscribe to API Catalog if your application will be used for Oracle Integration Cloud (OIC) Hospitality Adaptor.

- 11. Click **View API documentation** to view the API documentation for the Oracle Hospitality APIs to which the application will be subscribed.
- **12.** Click **Register**. The message *Application Registered Successfully* confirms the registration.

13. Your newly registered application appears at the top of the list on the **Applications** tab.

You are allowed a maximum of 100 applications for registration. You cannot register additional applications if you have reached the allowed limit. If you do so, the following error appears:

Error: Cannot create your application as you have reached the maximum number of applications allowed.

Viewing Application Details

When viewing your application details, you can view the application key, the application contact details, application description, application type, and so on. The application key is masked by default.

To view Application Details:

- 1. On the Oracle Hospitality Developer Portal, click **Applications**.
- On the All Applications page, select the registered application for which you want details.
- 3. Click View details.

Viewing the Application Key

When in your application details, you can view and copy the application key. The application key is masked by default.

To view and copy your Application key:

- 1. On the Oracle Hospitality Developer Portal, click **Applications**.
- 2. On the All Applications page, select the application for which you need the application key.
- 3. Click View details, and then under the Application Key, click Show or click Copy.

Editing Application Details

Edit an Application from the Application details page:

- 1. On the Oracle Hospitality Developer Portal, click the **Applications** tab.
- 2. On the Applications page, click View details.
- 3. On the Overview tab, click the pencil icon.
- 4. In the Edit Application Details dialog, edit the details, and then click Save.

Deleting an Application

Note:

There are some important points to understand when you want to delete an application:

- You cannot delete an application if you have outstanding billing charges.
- You cannot delete an application that is still subscribed to consume events
 using the streaming API. Unsubscribe from these events first, then delete the
 application.
- Deletion cannot be undone, which means you will permanently remove any historical data and the app key will no longer work. Once you delete your app, you cannot restore it.

If you want delete your application, follow these steps:

- 1. On the Oracle Hospitality Developer Portal, click the **Applications** tab.
- 2. On the Applications screen, click View details.
- On the Application Details page, in the Overview tab, click the Delete icon and click Delete again to confirm.

The following message appears when you click the **Delete icon**:

"Are you sure you want to delete the [App_Name] application?

Deleting an application will permanently remove any historical data, and the app key will no longer work. You won't be able to restore it."

Editing an Application Subscription

To change the APIs to which an application is subscribed:

- 1. On the Oracle Hospitality Developer Portal, click the **Applications** tab.
- 2. On the Applications page, click **View details** for the application.
- 3. Click the **Subscriptions** tab.
- 4. On the **Subscriptions** tab, click the **pencil icon** to edit.
- Make your desired edits and click Save.

Get a Portable Export of My Application Details

If you need a Portable Export of your Application Details, create a ticket in the Customer Support Portal.

Reissuing an Application Key

A unique application key is created for each application, which must be sent in the header of every request to Oracle Hospitality APIs. You can reissue a key for an application from its Overview page.

Important:

When you reissue a key, requests to the Oracle Hospitality APIs that an application is subscribed to will fail until you send them the new key.

- 1. On the Oracle Hospitality Developer Portal, click **Applications**.
- 2. On the Applications screen, select the application for which you want to reissue the key.
- Click View Details.
- 4. Click the **Show** link to see the unique application key that is created for your application.
- 5. Click the Reissue link.
- Click Reissue at the confirmation message prompt.
- 7. The reissued application key appears instantly. Click Hide to hide the key.

Suspending an Application

If you wish to temporarily suspend your Application, create a ticket in the Customer Support Portal.

After the application is suspended, you can no longer make Oracle Hospitality API calls using that application.

4

Call Usage Alerts

Call usage alerts trigger an email when API usage is near or exceeds the limit assigned for API calls to an environment. On the **Alerts** tab under **Applications**, you can configure the call limit for each application and its environment(s). With call usage alerts, you can do the following:

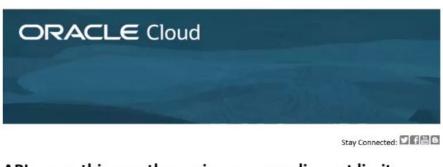

- Create a new usage alert setting
- Adjust a usage alert setting
- Remove a usage alert setting

Call usage alerts are beneficial to developer portal users concerned about unexpected spikes in usage. To avoid this potential problem you can set call limits, enabling you to better budget and monitor your API calls.

When you approach or exceed your call limit, an email is sent. Only one usage alert email is sent per day per application listing all the environments being called by the application that approach or exceed the assigned usage limit.

Figure 4-1 Usage Alert Email Example

API usage this month nearing or exceeding set limits

Oracle Cloud Customer,

Your API usage this month is nearing or has exceeded the limits you set in the Oracle Hospitality Integration Platform Developer Portal.

As a reminder, API usage counts reset each month so this alert is based upon your usage this current month.

This is not a hard limit: If you make more API calls than the limit you've assigned these API calls will still be processed.

Application

Environments

has received 84525 API calls out of the set limit of 50000.

has received 78525 API calls out of the set limit of 50000.

More information about the call limits feature is available in the Oracle Hospitality Integration Platform user guide, which also contains advice on how to change the limits and how to change the recipient of these alerts.

Thank you,

Oracle Cloud Services

Usage alerts do not prevent API calls from exceeding the chosen limit and only provide information in an email about the environments and applications that are near or exceed the call limit.

If you are using multiple applications or calling multiple environments, it is recommended to set a low limit for each environment on each application. For calls to non-production environments, a default of 10,000 calls is set for the limit, but no default limit is set for calls to production environments.

You can view your current usage in the Analytics tab.

Configuring Call Usage Alerts

You set call usage limits at the application level. Since an environment can be used for multiple applications, you can set different call usage limits for the same environment.

Setting a Call Usage Limit

- 1. On the Developer Portal, click **Applications** and then select an application by clicking it.
- Click the Alerts tab.
- 3. Choose an environment and click the pencil icon for it.
- Click the up or down arrow for the Usage Alert Setting to increase or decrease the usage limit.
 - Selecting the up arrow increases the limit and selecting the down arrow decreases it.
- 5. Click Save.

Removing a Call Usage Limit

If you no longer wish to receive usage alert emails, set the **Usage Alert Setting** to zero on each environment for each application.

- 1. On the Developer Portal, click **Applications** and then select an application by clicking it.
- 2. Click the Alerts tab.
- 3. Choose an environment and click the pencil icon for it.
- 4. Click the down arrow for the **Usage Alert Setting** until the call limit is zero.
- 5. Click Save.

Changing the Recipient for Usage Alerts

The email address on the Overview tab of an application is the email address to which usage alerts are sent. This can be changed at any time and takes effect within 24 hours.

- 1. On the Developer Portal, click **Applications** and then select an application by clicking it.
- 2. On the Overview tab, under Contact Details, click the Question Mark button.
- 3. Enter a valid email address for the new recipient.
- 4. Click Save.

Environments (Gateways and Credentials)

From the Environments page in the Developer Portal, partners can view the information (that is, clientId, clientSecret, and gateway URL) required for calling the partner sandbox. Partners who have purchased non-production OPERA Cloud environments can also obtain this information. Once partners are ready to call a hotel's environment, they can add a new environment and obtain the clientId, clientSecret, and gateway URL details.

Customers can also view their environment's clientId, clientSecret, and gateway URL on the Environments page.

Viewing Partner Sandbox Details

- Open the Developer Portal and click Environments at the top of the page. Within the Partner Sandbox section, you can view and copy your Client ID, Client Secret, and Gateway URL.
- Click the Generate your integration username and password link to create your integration user with the specified Tenant ID.

Adding an Environment

Prerequisites for Adding an Environment

- Only partners can add an environment. Customers can by default view their environments. For more information, see Viewing Environment Details.
- The hotel must be using OPERA Cloud Foundation before you can add an environment.
- Partners must ask customers if they can provide the Enterprise ID or if they need an integration user to be created for integration.
- In the case of an integration user, you must create an integration user and have the user approved by the hotel before adding an environment. See Authenticating to Oracle Hospitality Property APIs for steps to create an integration user.

To Add an Environment

If using the Integration Username:

- 1. Open the Developer Portal and click **Environments** at the top of the page.
- 2. Click Add Environment.
- Select integration username.
- Enter the Integration Username for your integration user.
- Select your Region.
- Select whether the environment you are adding is a Non Production or Production environment.

7. Click Add.

If using the Enterprise ID:

- 1. Open the Developer Portal and click **Environments** at the top of the page.
- 2. Click Add Environment.
- 3. Select Enterprise ID.
- 4. Enter the **Enterprise ID** and **chain code** received from the customer. An information message is rendered to confirm that the access request is sent for all the gateways of the chain.
- 5. Select your **Region**.
- 6. Select whether the environment you are adding is a **Non Production** or **Production** environment.
- Click Add.

The environment request is sent to the customer for approval within the customer developer portal and the status of the environment is "Pending Approval." Once approved, you can view the environment details. For more information, see Viewing Environment Details.

Error Messages

If you encounter an error message when adding an environment, it could be for a variety of reasons, such as the environment owner not yet approving the integration user. The Add Environment page lists the environment errors and recommends the next course of action. If the recommendation is to raise a support request with Oracle Customer Support at the Customer Support Portal, include the exact error message and error code in your support request as this will shorten the resolution time.

If you add back a removed environment, you must use the same integration username that was previously used to add the environment. The error message will inform you which integration username was previously used to add the environment.

Viewing Environment Details

- 1. From the Developer Portal, click **Environments** at the top of the page. All your environments appear on this page.
- 2. Click the View Details link for the environment you want to view.
- The following details appear based on the authentication scheme of the customer's environment.
 - a. Gateway URL for the environment.
 - b. Client ID and Secret. If the Client ID and Client Secret do not appear, you can create these by clicking the Create Client Credentials button.
 - c. Authentication scheme supported by the environment. This could be one of the following:
 - Resource Owner Group
 - Client Credentials

Based on the authentication scheme supported by the environment, additional details required for authentication appear in the environment details section.

- Unique Enterprise ID of the customer
- Authorization Scope of the client representing the access permissions assigned to the client for the environment.

For more information on the details required for authentication, see Authenticating to Oracle Hospitality Property APIs.

Viewing the Client Secret

- 1. From the Developer Portal, click **Environments** at the top of the page.
- 2. Click the View Details link for the environment you want to view.
- 3. Click the Show link for the Client Secret.

Changing Your Client Secret

To change/reissue your Client Secret:

- 1. From the Developer Portal, click **Environments** at the top of the page.
- 2. Click the View Details link for the environment.
- 3. Click the **Reissue** link for the Client Secret and click **Reissue** again to confirm.

The following message appears when you click **Reissue**:

"Are you sure you want to reissue the Client Secret? This will affect the following environments: [A list of environments appears]

The current Client Secret will no longer work for the above environment(s)."

Removing an Environment

Note:

- When you remove an environment, it will cease sending any events to which you have subscribed via the streaming API.
- You can add back the environment, but it will be subject to the customer's approval.
- If you add back an environment, you must use the same integration username that was previously used to add the environment.
- **1.** From the Developer Portal, click **Environments** at the top of the page. All your environments appear on this page.
- 2. Click the **View Details** link for the environment you want to remove.
- 3. Click Remove Environment and click Remove to confirm.

The following message appears when you click Remove Environment:

"Are you sure you want to remove this [Environment_Name] environment?

You can add the environment again, and it will be subject to customer's approval."

Migrating to Client Credentials-Based Authentication Scheme

Follow the below steps only for environments that are migrated from a resource owner-based authentication scheme to client credentials-based authentication scheme.

Before migrating the environments in the partner portal, you must confirm with the customer based on the authentication scheme reflected in the environment details section of the customer's environment in the OHIP customer portal.

- Add the environment using the Enterprise ID and chain code obtained from the hotel. For more information, see Adding an Environment Using Enterprise ID.
- Generate the Client ID and Secret and make note of the same. For more information, see Viewing Environment Details.
- 3. Fetch the **Enterprise ID** and scope from the enterprise details section. For more information, see Issuing the Client Secret.
- Confirm that the authentication scheme for the environment was changed to Client Credentials.
- Update the OAuth token API request with the following details:
 - a. Client ID and Secret
 - b. Enterprise ID
 - c. Scope
- Remove the integration username and password.
- Get a new token using the OAuth API request using Client Credentials-based authentication. For more information, see Authenticating to Oracle Hospitality Property APIs.

The below image depicts the changes you must make in the OAuth token API. These changes enable you to use the client credentials-based authentication scheme.

8. Update all further property API requests with a new OAuth token.

Adding an Environment Using Enterprise ID

Prerequisites

- Only partners can add an environment. Customers can by default view their environments. For more information, see Viewing Environment Details.
- The hotel must be using OPERA Cloud Foundation before you can add an environment.
- Partners must check with customers to determine if they can provide the Enterprise ID.
 For more information, see Obtaining Details from the Hotel.

Adding an Environment

- Open the Developer Portal and click Environments at the top of the page.
- 2. Click Add Environment.
- 3. Select Enterprise ID.
- 4. Enter the **Enterprise ID** and **Chain Code** received from the customer. A message appears and confirms that the access request is sent for all the gateways of the chain.
- Select your Region.
- Select if the environment you are adding is a Non Production or Production environment.
- 7. Click Add.

The environment request is sent to the customer for approval within the customer developer portal (see Managing Partner Connections) and the status of the environment is "Pending Approval." Once approved, you can view the environment details. For more information, see Viewing Environment Details.

Viewing Environment Details

- 1. From the Developer Portal, click **Environments** at the top of the page. All your environments appear on this page.
- 2. Click the View Details link for the environment you want to view.
- The following details appear based on the authentication scheme of the customer's environment.
 - a. Gateway URL for the environment.
 - **b. Client ID** and **Secret**. If the Client ID and Client Secret do not appear, you can create these by clicking the **Create Client Credentials** button.
 - c. Authentication scheme supported by the environment. This could be one of the following:
 - Resource Owner Group
 - Client Credentials

Based on the authentication scheme supported by the environment, additional details required for authentication appear in the environment details section.

- Unique Enterprise ID of the customer
- Authorization Scope of the client representing the access permissions assigned to the client for the environment.

For more information on the details required for authentication, see Authenticating to Oracle Hospitality Property APIs.

Issuing the Client Secret

For enhanced security, the client secret can be viewed only once for environments supporting a Client Credentials-based authentication scheme. It is required for customers and partners to note the client secret once it is issued. If the client secret is lost, a new secret must be issued and all integrations must be updated with the new client secret.

- 1. From the Developer Portal, click **Environments** at the top of the page.
- 2. Click the View Details link for the environment you want to view.
- 3. Click the Issue link for the Client Secret.
- 4. Click the **Issue** button on the confirmation message, which indicates the environments that will be affected once the new client secret is issued.
- 5. Click the **Copy** button to copy the new client secret.

If the Client ID and Client Secret do not appear, you can create them by clicking the **Create Client Credentials** button.

Managing Partner Connections

For customer environments supporting a Client Credentials-based authentication scheme, an additional layer of security has been added to control the access of customer environments for different partners.

Note:

For customer environments supporting a Resource Owner Group-based authentication scheme, partner connections are auto-approved based on the approval and role assignment of the integration user.

Approving Partner Connections

When a partner submits a new request to add a customer environment, follow the below steps in the OHIP customer portal to approve the partner's connection request.

- 1. From the Developer Portal, click **Environments** at the top of the page.
- 2. Click **Partner Connections**. All the partner connections appear in this section.
- 3. Search for the partner connection that is pending approval.
- 4. Click **Approve** to approve the partner connection request. The status of the partner connection request should change to "Approved" in both the customer and partner portal.

Rejecting Partner Connections

When a partner submits a new request to add a customer environment, follow the below steps in the OHIP customer portal to reject the partner's connection request.

- 1. From the Developer Portal, click **Environments** at the top of the page.
- 2. Click **Partner Connections**. All the partner connections appear in this section.
- 3. Search for the partner connection that is pending approval.
- 4. Click Reject to reject the partner connection request. The status of the partner connection request should change to "Rejected" in the Environment section of both the customer and partner portal.

Sandbox Availability

Partners wanting to integrate with customer environments supporting client credentials-based authentication scheme must work with the respective customer's non production environment.

6

Using the Oracle Hospitality APIs

Having created an application and obtained the gateway URL from the portal, calling APIs is a four-step process:

- Obtain details from the hotel. In the case of the partner sandbox, the hotel code is SAND01.
- 2. Add an environment. See Environments Gateways and Credentials for details.
- Authenticate: Obtain an oAuth token using the oAuth API in a call sent to the gateway URL.
- **4. Call APIs**: Send your API calls to the gateway URL following the API documentation displayed in the portal.

Oracle Payment Interface APIs

Overview

Reservations created via third-party channels often include a credit card number to secure the booking. The OPI Token Exchange API openPaymentBulkTokenExchange will allow partners to exchange credit card numbers for tokens, using the Payment Service Provider that OPERA Cloud is integrated to for payment processing. The tokens are then stored in OPERA against the reservation and can be used for subsequent payments as needed.

Prerequisites

To call the OPI Token Exchange API, the hotel must purchase and enable the Oracle Payment Interface Cloud Service.

Calling the Oracle Payment Interface APIs

Oracle Payment Interface APIs are called in the same way as Oracle Hospitality Property APIs.

If the hotel does not have the Oracle Payment Interface Cloud Service enabled, the following error is returned:

HTTP status: 404

Response body: OPICS-NOT_FOUND

Refer to the explanation of this error for resolution steps.

Oracle Hospitality Nor1 Integrated Upsell APIs

Obtaining Details from Oracle Hospitality Nor1

You must request access to the Nor1 Upgrades APIs by emailing the Nor1 team (hgbu_nor1_partner_rqs_grp@oracle.com) and providing the following details:

Partner Organization Name

- Oracle Cloud Account Name
- Oracle Cloud Account ID

Provide the following details if you are an OPERA Cloud Foundation customer:

- Tenant / Chain Code
- SSD URL
- Indicate if the chain is a Production or UAT chain

After sending the email, you will receive further instructions within 5 business days. Once access is granted, Oracle will send you the following:

 providerId — This is your Nor1 unique provider code that is global and used across all hotels.

Authenticating to Oracle Hospitality Nor1 Upgrades APIs

The Nor1 Upgrades APIs are secured the same way as the Oracle Hospitality Property APIs. For further details, refer to the following topics:

Changing Your Integration User Password

Integration User passwords expire after 1 year and must be changed every year. To change your password:

- 1. Find the email you received when the hotel approved your integration user. This includes a URL for the Shared Security Domain identity server. Go to this URL.
- Log in using your integration username and password.
- 3. Go to the "My Information" panel. This will show you basic information about your integration user.
- 4. Expand the "Change Password" section.
- 5. Reenter your current integration user password.
- 6. Enter your new integration user password twice. Please note the password policy, which can be viewed by clicking the "i" icon next to the New Password field.

API Troubleshooting

If you are experiencing issues when consuming APIs, check the following:

API

- Verify the API you are calling is visible in the APIs tab of the developer portal.
- Verify the API version in the URL matches the version v0 or v1 listed in the developer portal.
- If connecting to OPERA Cloud, verify the functionality being used is active and available for the relevant OPERA Cloud PMS version by reviewing the following quides:
 - OPERA Cloud Services Release Readiness Guide 23.2
 - OPERA Cloud Services Release 23.2

Verify the input variables are relevant to the OPERA system being called and are not a
copy of Postman samples. Note that each OPERA environment is uniquely
configured. You can determine the configuration specific to the hotel you are calling by
reviewing the List of Values and Enterprise Configuration APIs.

Environment and Credentials

- Verify the environment (chain) card is on the Environments tab in the developer portal.
 - If you are an integration partner and the environment is not listed, then follow the steps in the Obtaining Details from the Hotel topic to gain access.
 - If you are an integration partner and this is a production environment, verify you have followed the steps in the Moving to Production topic.
- Verify the application's second tab shows the plans expected in the developer portal.
- Verify the application key being used matches the application checked in step 2 in the developer portal.
- Verify the clientId and clientSecret correspond to those on the Environment card under the Environments tab in the developer portal.
- Verify the following for the integration user:
 - 1. The user is in the organization I<SSD org code>
 - a. The user was created from the SSD URL ending "?apiuser=y"
 - 2. The username does not have spaces in it.
 - **a.** If spaces in the current username exist, create a new integration user with a shorter username with no spaces.
 - 3. The user has the <SSD org code>-WSACCESS role.
 - a. Log in to SSD using the link in the "Thank you" email and then go to "My Access" to see if the user has the WSACCESS role.
 - **b.** If not, contact the environment owner and ask for approval for this role.
 - 4. Verify if the oAuth token is still valid (note the token lasts for 60 minutes). Obtain a new oAuth token to ensure it is valid.

Mandatory Headers

Verify the required headers:

- Calling OPERA Cloud Property APIs Ensure the x-hotelid header matches a hotel in the chain being called.
 - OPERA Cloud Property APIs for OPERA Cloud 22.1+ When verifying data for the hub level, ensure you send x-hubid and not x-hotelid.
- Calling Oracle Hospitality Distribution APIs Verify the x-channelCode header matches the header provided via email by the Oracle Hospitality Distribution team.
- Calling NOR1 Upgrade API Ensure the providerId header matches the header provided via email by the NOR1 team.
- If sending a POST request, ensure you are sending the "accept" header as "application/ json."

Errors

Verify the list of errors and follow the suggested resolution paths.

Logging an Issue

Before reporting an issue, first exhaust the self-service troubleshooting.

If you still have an issue with an API, ensure you include the following information when logging the issue:

- Full CURL request (with credentials redacted)
- Response code
- OPERA environment version number (via this API)
- OPERA environment name or gateway URL
- Context of what is being attempted (for example, type of integration, task being carried out, and so on).

Common HTTP Errors and Messages

Common error codes produced by Oracle Hospitality APIs are listed in the following table.

For a complete list of OPERA Cloud REST API error codes, refer to the Web Service Error Codes topic.

Table 6-1 Common HTTP Error Messages

Error Status	Error Response Body	How to Resolve
400	Response body details which fields are at fault.	Change the fields mentioned in the error response, such that they align with the specifications; referencing the swagger spec will help here. In some cases the values are determined by a (hotel specific) configured List of Values (LOV), so ensure you supply a value that is in the LOV for that hotel; the List Of Values Oracle Hospitality APIs will help here.
400	This API is not supported for the current database version.	Contact Oracle Customer Support at the Customer Support Portal stating the gateway being called and the error message received.
401	No response body	Ensure your oAuth token is valid and latest. Also, ensure your Application Key is valid. Check it by Viewing the Application Key

Table 6-1 (Cont.) Common HTTP Error Messages

Error Status	Error Response Body	How to Resolve
401	"invalid_grant", "[Wrong Password]"	Check the password of the integration user. See Changing Your Integration User Password for more information.
401	UnAuthorized to access the resource	This could be caused by the integration user missing the WSACCESS role. Ensure the environment owner has approved the integration user. This could also occur if you are sending the wrong hotelId. Ensure the hotel ID being sent in the x-hotelid header matches a hotel in the environment being called.
403	No response body	Ensure your oAuth token is valid and up to date. Rerequest it by using Authenticating to Oracle Hospitality Property APIs. Also ensure your integration user in OPERA Cloud Services has access to the property (hotel) you supplied in the "x-hotelid" header.

Table 6-1 (Cont.) Common HTTP Error Messages

Error Status	Error Response Body	Ho	w to Resolve
403	No Subscribed Plan or API found	an.	is occurs when accessing API to which you do not we access.
		(v0) alro che spe hea Ear	his is an early adopter) API and you think you eady have access to the rly Adopter API Program, each that the application edified in the x-app-key ader has access to the rly Adopter APIs by lowing this process:
		1.	In the Developer Portal, click the Applications tab.
		2.	Choose the application whose key matches the x-app-key being sent (double check against the end of the application key that appears in the list of applications).
		3.	Click View details
		4.	Click the Subscriptions tab and verify it shows all of the following: Early Adopter Hospitality APIs OAuth
		the to, in t	ou have not yet called to 0 APIs but would like contact us as explained the Early Adopter API ogram.
		you	his is a Distribution API, I must register in the veloper Portal to use the I.

Table 6-1 (Cont.) Common HTTP Error Messages

Error Status	Error Response Body	How to Resolve
403	User is not authorized to access data for resort	Check that your integration user has the WSACCESS role: • Find the email you
		received when the hotel approved your integration user. This includes a URL for the Shared Security Domain identity server. Go to this URL.
		 Log in using your integration username and password.
		 If the login fails, click the "Can't Sign In?" link to reset your password.
		 Verify the hotelId supplied in the "x- hotelid" header matches the one provided by the hotel. See Obtaining Details from the Hotel for more information.
404	No response body	If you are calling an Asynchronous API:
		Once you have sent the final GET call to obtain the results of the async processing, the data is no longer available on the same summaryId, so you will receive a 404 error. To retrieve the data again, you must restart the request sequence at step one.
404	OPICS-NOT_FOUND	Contact the environment owner to verify that Oracle Payment Interface Cloud Service has been set up by checking for product ID 14308 and ensuring that Token Exchange Service is selected. Customers can contact Oracle Consulting or a reseller to configure Oracle Payment Interface Cloud as needed.
405	No response body	Ensure the HTTP verb you are using is supported by the Oracle Hospitality APIs by checking the Oracle Hospitality APIs documentation.

Table 6-1 (Cont.) Common HTTP Error Messages

Error Status	Error Response Body	How to Resolve
406	No response body	Set your "accept" header to "application/json" as the Oracle Hospitality APIs will produce only "application/json".
413	No response body	Ensure your request matches the documented request body schema. If your scenario requires "bulk" fetch or update then consider the jobbed Oracle Hospitality APIs.
414	No response body	Consider whether you need to specify all the query parameters being specified; there may be more efficient resources or ways to structure your query.
415	Unsupported Media Type	Ensure your request payload has a content-type of "application/json".
500	Response body details the error.	Try your request again in a few moments or contact Oracle Customer Support at the Customer Support Portal.
502	No response body	Try your request again in a few moments or contact Oracle Customer Support at the Customer Support Portal.
503	No response body	Try your request again in a few moments or contact Oracle Customer Support at the Customer Support Portal.

HTTP Methods Supported

The Oracle Hospitality APIs use the following HTTP verbs:

- GET to retrieve resources.
- HEAD to query the status of jobbed requests.
- POST to create resources.
- PUT to replace resources.
- DELETE to delete resources.

HTTP Response Headers

POST always returns the location of the newly created resource in a Location header.

Github and Postman Collections

Oracle Hospitality has a Github repository containing both Oracle Hospitality REST API specifications and accompanying Postman Collections.

You can access Github and locate the REST API specifications and Postman Collections at the following URL: https://github.com/oracle/hospitality-api-docs.

REST API Specifications

In the rest-api-specs folder in Github, you can view the published V1 APIs for OPERA Cloud and/or download the json specifications for the Oracle Hospitality APIs.

Postman Collections

In the postman-collections folder in Github, you can download and use the Postman Collection to help you get you started with our APIs and become more familiar with using them. The postman-collections folder contains the following content:

- Postman collections with many different API call samples on how to perform different functional workflows (for example, digital check-in and checkout).
- Postman Environment defining the main environment variables required to use the
 postman collections against our Hospitality APIs. Ensure you update this file with the
 relevant credentials and data for the environment to which you are connecting.
- Document describing the different workflows supported in the postman collections.

The Postman collection is also available at the following URL: https://www.postman.com/hospitalityapis/workspace/oracle-hospitality-apis/overview.

Setting Up Your Postman Collection

To start calling the APIs, proceed to set up a postman environment collection using the below information. You might want to configure one environment collection for UAT and another one for Production as the variables will differ.

Table 6-2 Information for Postman Environment Collection

Hostname	This is the API gateway URL that can be viewed by logging into the Developer portal and viewing the environments tab.
Username & Password	This is the Integration username and password. See Authenticating to Oracle Hospitality Property APIs for the steps to obtain these.
CLIENT_ID & CLIENT_SECRET	The Client ID obtained from the OHIP Developer portal. See Viewing the Client Secret for details.
АррКеу	The application key that was previously obtained. See Viewing Application Details for the specific steps.

Table 6-2 (Cont.) Information for Postman Environment Collection

	The Hotel ID against which you want to perform actions (for example, obtaining reservation data).
--	---

Once you have added these values into your postman environment, you can begin to call the oAuth Token. If everything is set up correctly, OHIP will respond with a HTTP 200 OK response, including the oAuth token. Now you can proceed to try out the collections as required.

Date Formats

Dates in the Oracle Hospitality APIs are expressed in the RFC3339 "full-date" format (that is, date-fullyear "-" date-month "-" date-mday. "T" time-hour ":" time-minute ":" time-second "Z" / ("+" / "-") time-hour ":" time-minute). The following are examples of this format:

- 2023-06-05 for 5th of June 2023
- 2023-06-05T08:43Z or 2023-06-05T09:43+01:00 for 5th of June 2023 at 8:43 AM in the UTC time zone or 9:43 in the local time zone

Most times are expressed in local time zones, not in Coordinated Universal Time (UTC).

Oracle Hospitality Property APIs

This section contains the following topics:

Obtaining Details from the Hotel

OPERA Cloud resources are available only via the Oracle Hospitality Integration Platform if the hotel company is using OPERA Cloud Foundation. You will need the following pieces of information from the hotel whose data you are accessing:

- Production or Non Production: Many hotels run non production OPERA Cloud environments as well as their production environment(s). Determine whether the OPERA Cloud environment you are calling is a production or non production instance.
- Region: The region in which the hotel's OPERA Cloud environment is running.
- **Tenant / Chain Code**: The hotel's tenant code used to target the right tenant especially in OPERA Cloud environments that host multiple tenants.
- **Hotel ID**: The OPERA internal ID of a hotel in the customer's tenant.
- SSD URL: The URL on which to create an integration user.

Follow these steps to obtain this URL:

- Ask the customer for their OPERA login page URL.
- Go to this customer provided URL.

3. Click the **Register new account** button on the OPERA login page to arrive at the OPERA Shared Security Domain (SSD), which has a URL like the following:

 $https://rp15-prod2-ssd-ohs.oracleindustry.com/identity/faces/register?\\ _afrLoop=4294503438550013\&_afrWindowMode=0\&_afrWindowId=null\&_adf.ctrl-state=segh9ko67_1$

4. Change this URL to a format similar to the following example by replacing the section after the question mark with "apiuser=y". This is the URL for creating an integration user.

https://rp15-ssd-ohs.oracleindustry.com/identity/faces/register?apiuser=y

For environments supporting the Client Credentials authentication scheme, the below details must be obtained:

This only applies to environments supporting the Client Credentials authentication scheme.

- Enterprise ID: Unique identifier for the enterprise. This can be found in the OHIP customer portal URL of the customer.
 - For production environments: https://<domain>/<enterpriseldprod>/ui.
 - For non-production environments: https://<domain>/<enterpriseId>uat/ui

For example, the enterprise ID for customers with a customer portal url (that is, https://oracletest.com/testenterpriseprod/ui) would be **testenterprise**.

Authenticating to Oracle Hospitality Property APIs

You can call Oracle Hospitality APIs using different authentication schemes depending on the scheme supported by your environment. The authentication scheme supported by your environment can be found on the environments card under the Environments tab. For more information, see Viewing Environment Details.

Resource Owner-Based Authentication

To call Oracle Hospitality APIs using the Resource Owner-based authentication scheme, you need the following pieces of information:

1. Integration username and password: A username and password for an integration account in Oracle Hospitality Shared Security Domain granted by a hotel administrator to permit access to their data. This is one of the pieces of information needed to obtain the oAuth token. You can request this through the Oracle Hospitality Shared Security Domain (SSD) partner self-service registration portal. Completing and submitting this form sends a partner registration request to the OPERA customer for approval.

Note:

Every partner must have a unique integration user. This integration user is unique to one OPERA Tenant/Chain. Therefore, if you are accessing multiple OPERA Tenants/Chains, you need to request multiple integration users.

Please ensure you are signed out of the Oracle Hospitality Shared Security Domain (SSD) before requesting your integration user. If you are signed out, 'Anonymous' appears at the top right of the screen.

- Go to the SSD URL you obtained from the customer. For more information, see Using the Oracle Hospitality APIs.
- Specify the Tenant /Chain code as advised by the hotel, or else enter hotel code(s) advised by the hotel.
- Avoid spaces in the **Vendor** name field and keep the name to a maximum of 10 characters.
- Once the hotel approves your integration user, you will receive an email.
- For more information on this step, refer to the *Partner Self-Registration Guide* attached to the following Customer Support Portal document:

Oracle Hospitality Shared Security Domain (SSD) for OPERA

Note:

Please note and keep secure your generated interface ID and key. The interface ID is your integration user's username, and the interface key is your integration user password.

- 2. OAuth Client ID and Client Secret: These grant you access to the identity servers (Oracle Hospitality Shared Security Domain). See Environments (Gateways and Credentials) for steps on how to view or add these.
- 3. Application key: A unique application key is created for each application upon registering an application in the Oracle Hospitality Developer Portal. This key must be passed in the "x-app-key" header of every request to the Oracle Hospitality APIs. To obtain your application key, refer to Viewing the Application Key.

Note:

A new application and its corresponding application key are required when you move to Production.

Client Credentials-Based Authentication

Only follow these steps if this authentication scheme appears on the **Environments** tab.

To call Oracle Hospitality APIs using the Client Credential based authentication scheme, you need the following pieces of information:

- OAuth Client ID and Client Secret: These grant you access to the identity servers (Oracle Hospitality Shared Security Domain). See Environments (Gateways and Credentials) for steps on how to view or add these.
- 2. Application Key: A unique application key is created for each application upon registering an application in the Oracle Hospitality Developer Portal. This key must be passed in the "x-app-key" header of every request to the Oracle Hospitality APIs. To obtain your application key, refer to the Viewing the Application Key topic.

A new application and its corresponding application key are required when you move to Production.

- **3. Scope**: A static variable that represents the authorization scope and permissions granted to the client for accessing the APIs from OHIP.
- 4. Enterprise ID: A unique ID for the enterprise for which the client is created.

To obtain your oAuth token, use the above details in the 'Authenticate with the Identity Server' call in the oAuth API. You can find this description in the oAuth API on the APIs page of the Developer Portal.

https://oauth34.docs.apiary.io/reference/authentication/oauthv1 to kens/authenticate-with-the-identity-server.

Send this oAuth request to the gateway URL listed in the Developer Portal.

oAuth tokens expire after 1 hour (60 minutes). Currently, we do not support refresh tokens.

Calling Oracle Hospitality Property APIs

All Oracle Hospitality APIs expect the following mandatory headers:

1. Token: A header "Authorization" that includes the oAuth token obtained through Authenticating to Oracle Hospitality APIs.

- 2. x-hotelid: Supply a hotel (or property) code from the chain to which you have access in a header "x-hotelid." This is the Hotel ID you obtained from the hotel. If you do not know your x-hotelid, contact Oracle Customer Support at https://iccp.custhelp.com.
- 3. Application key: An unique application key is created for each application upon registering an application in the Oracle Hospitality Developer Portal. This key must be passed in the "x-app-key" header of every request to the Oracle Hospitality APIs. To obtain your application key, refer to Viewing the Application Key

Required Headers:

- x-app-key:<ApplicationKey>
- x-hotelid:<HotelId>
- Authorization: Bearer <oAuth Token>
- x-hubid When you have hub-level access, you can supply the x-hubid to retrieve multiple properties.
- x-externalSystem If you have an external system in an OPERA environment (for example, for use with streaming or polling), then specifying that external system in the header of inbound API calls will avoid echoing those changes back to the streaming and polling APIs. For the streaming APIs, the external system code is shown on the application's Events Subscribed tab.

Optional Headers:

- x-hubid When you have hub-level access, you can supply the x-hubid to retrieve multiple properties.
- x-externalSystem If you have an external system in an OPERA environment (for example, for use with streaming or polling), then specifying that external system in the header of inbound API calls will avoid echoing those changes back to the streaming and polling APIs. For the streaming APIs, the external system code is shown on the application's Events Subscribed tab.

Example

GET https://<Gateway Domain>/lov/v1/listOfValues/Titles

The below table lists the environment variables you can add to the Postman Environment.

Table 6-3 Postman Environment Variables

Variable	Value
- Variable	value
AppKey	This value is accessed from the Developer Portal.
ClientId	This value is accessed from the Developer Portal.
ClientSecret	This value is accessed from the Developer Portal.
HotelId	This value is supplied by the hotel.
Password	This value is accessed from the "Interface Key" in the vendor self-registration portal.

Table 6-3 (Cont.) Postman Environment Variables

Variable	Value
Username	This value is accessed from the "Interface Id" in the vendor self-registration portal.

API Throttling

The Oracle Hospitality Integration Platform (OHIP) APIs are throttled. Throttling limits the number of concurrent calls to OPERA Cloud to avoid impacting day-to-day hotel operations. If more than 50 requests per second are received for a single OPERA Cloud environment, throttling helps maintain the day-to-day running of the hotel while still enabling API traffic. The 51st and subsequent requests received in a single second will be delayed by 1000 milliseconds. This throttling limit may be changed to protect day-to-day hotel operations. We provide advance warning of changes when possible. If you are frequently hitting the throttling limit, consider the following:

- For Shop & Book related calls, consider Distribution APIs (see Oracle Hospitality Distribution APIs for more information).
- Retrieve more coarse grained data in a single call rather than performing filtering in the client.
- Reduce the frequency of calls.
- Cache data that changes infrequently, such as Lists of Values.
- Review the API release notes for new operations that could reduce the frequency of API calls (for example, asynchronous (jobbed) operations).
- Consider Connecting to the Streaming API as an alternative to the Polling API.

Oracle Hospitality Asynchronous APIs

For long-running operations such as adding, updating, or retrieving large amounts of data, there is a series of Oracle Hospitality Property APIs called asynchronous ("async") APIs. These all work the same way with specific operation details available in the Developer Portal API documentation. Simply search for "Async" in the APIs tab.

Certain business use cases also require Asynchronous APIs, such as the Revenue Management System business use case, so refer to those specific business uses cases for details.

Creating the External System

All asynchronous operations require you to create an external system. This is so Oracle Hospitality OPERA Cloud knows for whom to process the request. The external system code is in the path of every Asynchronous API.

If you already have an external system created by the OPERA environment owner, ask them to check whether step 4–d is complete. If complete, you can use this for the Asynchronous APIs.

Only the (Customer) OPERA environment owner can create an external system. They should follow this process:

- Verify a chain-level user has the below tasks assigned. To assign these tasks, follow the steps in the Assigning Tasks to a Role topic in the OPERA Cloud User Guide.
 - a. Navigate to Interfaces Admin, Property Interfaces and External Systems.
 - b. Select New/Edit External Systems.
- 2. Log in at the Hub level (not the property level).
- 3. From the Administration menu, select **Interfaces**, select **Business Events**, and then select **External Systems**.
- 4. Click **New** and enter the following details:
 - a. Code: Enter a code for the external system.
 - **b. Description**: Enter a name of the external system.
 - **c. Sequence**: Specify sequence in which the external system will display in the External Systems list.
 - d. For each property in the chain, enter or select the **Property** and click **Active** to activate it.
- 5. Click Save.

Make sure you remember the external system code you created.

6. Communicate to the integrator the external system code created at step 4.

If customers have any challenges with creating the external system, they should either contact Oracle Customer Support at the Customer Support Portal (in case of a technical error) or contact Oracle Hospitality Consulting Services if additional help is needed.

Calling Asynchronous APIs

For Asynchronous APIs, the data flow is a three-step process. All three steps must be performed (that is, you cannot skip any step).

- POST request is the first step from an external system to OPERA, which can be performed to either:
 - a. Post bulk data to OPERA. This starts a process to accept the data into OPERA. The request size maximum is 2048 KB. If posting bulk data to OPERA that does not meet the API specifications, a validation error will be returned.
 - **b.** Fetch bulk data from OPERA. If fetching data, there may be a date limit range.
 - Once you have sent this post request to OPERA, you should receive a 202 Accepted response. In the header parameter Location, a summary ID is returned. This summary ID is important and required in the next step.
- 2. HEAD request is the second step from an external system to OPERA to check the status of the process started with POST request in the first step. Use the header parameter Location from the POST response in this HEAD request. Once the process is completed, the HEAD request returns a Status header with the value Completed, and a header parameter Location will contain a summary ID required in step 3.
- 3. **GET** request is the third step from an external system to OPERA to either collect the bulk data or confirm the post of data was successful. Use the Location Header returned by the HEAD response in step two. If you have added data, this GET

response returns the requested data or log details and advises if there is any failure.

Async APIs Call Limits

- A maximum of 90 requests per minute per gateway can be made to the Async API. Bear this in mind when determining how frequently to poll HEAD.
- In the operation startReservationsDailySummaryProcess in the OPERA Cloud Reservation Asynchronous API, a request that uses the parameter "lastModifiedDate" (available from OPERA version 22.5) can be called only once every 30 minutes. This restriction applies per hotel, but not per caller. This means if two callers pass exactly the same criteria for the same hotel, then only one caller will receive the results. The other caller must wait 30 minutes.
- A given request body can be called only once every 30 minutes when starting an Asynchronous API request.
- Since OPERA 23.2, HEAD requests return a header "retry-after" containing the number of seconds. We recommend waiting before calling HEAD again.
- Since OPERA 23.2, the final GET call to obtain the result of the Async API will include a "retry-after" header containing the number of seconds that will need to be waited before calling the same Async API again.

FAQs

How frequently should I send HEAD?

We suggest sending the HEAD request not more than once a minute, though the frequency will depend upon your use case.

When will the response be available?

There is no set length of time. Different requests require varying amounts of processing, and operational use of OPERA Cloud will affect the speed of responding to the request.

Can I use this external system for polling Business Events?

Yes, if you already have an external system configured for the Asynchronous APIs, the OPERA environment owner would just need to follow steps 3 and 4 in Configuring the Polling API.

Errors with Asynchronous APIs

404 Not Found

Once you have sent the final GET call to obtain the results of the asynchronous processing, the data is no longer available on the same summaryld. To retrieve the data again, you must restart the request sequence at step one.

429 Too Many Requests

Please check the above note on call limits and then try again after waiting the noted length of time.

Oracle Hospitality Distribution APIs

Obtaining Details from Oracle Hospitality Distribution

As a partner, you must request access to the Distribution APIs by contacting the Distribution team (hgbu_distribution_partner_rqs_grp@oracle.com) and providing the following details:

- Oracle Cloud Account Name
- Oracle Cloud Account ID

You will then receive further instructions within 5 business days.

Once access is granted, Oracle will send you the following:

- Channel Code This is your unique channel code that is global and used across all hotels.
- Integration User
- Gateway URL This is used to access the Distribution APIs in each environment requested.

Authenticating to Oracle Hospitality Distribution APIs

Prerequisites

- A Channel Code in the Distribution platform provided by Oracle.
- A valid integration user provided by Oracle upon creation of the channel code.

Getting a Token for Distribution APIs

Use the Distribution Authorization API to obtain the access token (in the JWT format) that matches the provided credentials issued by the Oracle Hospitality Distribution administrator for a specific Distribution channel partner (see Prerequisites section).

Use this token in every call to the Distribution APIs. Once a token is generated, it can be used in subsequent calls until it expires. The expiry date is noted in the API response.

The Distribution APIs are separate from the Oracle Hospitality Property APIs, and tokens generated by the Distribution Authorization API can only be used for Distribution APIs.

Calling Oracle Hospitality Distribution APIs

The Distribution Reservation Notifications API enables authorized channel partners to create and update reservations for any active property in Oracle Hospitality Distribution, whether that property is using OPERA Cloud, OPERA 5, or on-premise PMS versions.

This API is meant to transmit reservations already created and committed in the channel external system and does not perform any Pricing and Availability validation.

Headers

The Oracle Hospitality Distribution APIs require the following mandatory headers:

- **Token**: A header "Authorization" that includes the OAuth token obtained from the Oracle Distribution Authentication API.
- x-channelCode: A channel code provided by Oracle.
- Application key: An unique application key is created for each application upon registering an application in the Oracle Hospitality Developer Portal. This key must be passed in the "x-app-key" header of each request to the Oracle Hospitality APIs. To obtain your application key, see Viewing the Application Key.

For a list of Oracle Hospitality Distribution APIs, see Oracle Distribution APIs.

7

Analytics

The Analytics tab enables you to view the details of API usage, such as the total number of API calls, the number of API calls that were successful, and the number of API calls that failed or produced errors. With analytics, you can troubleshoot your API calls and quickly identify where the error is occurring in your application.

When paying for API usage, it is critical to know when one of your applications starts making unusual calls, so you can avoid unexpected bills and better plan your expense budget.

Analytics data enables you to ensure your applications are running correctly.

Usage does not exactly equate to what you are billed as there are a number of free calls. For a list of the API calls that are not billed, see FAQs.

Analytics data applies to both inbound and outbound API calls.

Search Parameters

You can filter analytics using the following parameters:

- Hotel ID
- Environment Type Non Production, Production, or All.
- Application
- Organization
- AP
- Date You can select the Last 24 Hours, Last 7 Days, Last 31 Days, Last 12
 Months, Current Billing Cycle, or Last Billing Cycle for partners. You can also select
 Custom to enter a specific date range. The last 24 hours is the default date in the
 search.

API Response Status Code

The response status code is the easiest way to understand what happened with an API request without reading and decoding the response body.

Using Analytics

You can view the details of usage analytics at a global level or at an application level. Each view includes a breakdown of error codes.

Viewing Analytics from the Main Analytics Tab

This provides a view of usage analytics at a global level.

- 1. Open the Developer Portal and click the **Analytics** tab.
- 2. Optionally choose search parameters to narrow results to specific hotel(s), environment type(s), application(s), organization(s), API(s), and date range:
 - **x-hotelids**: Enter the OPERA property ID of one or more hotels. This was sent in the x-hotelid header of the API request.
 - Call Type: Select either REST or Streaming for the call type. Alternatively, you can select All, which provides analytics for both REST and Streaming combined.
 - Environment Type: Select All, Non Production, or Production for your environment type. This selection is determined based on the environment being called, either a non production or production instance.
 - APIs: Select one or more API(s) from the list.
 - Application: Select one or more application(s) for which you want to view analytics.
 - **Organization**: Hoteliers can select whether to view their own analytics or those of one or more partner organization(s).
 - API: Select one or more API(s) from the list.
 - Choose Range: Select a date range from which to view usage analytics. You can select Last 24 Hours, Last 7 Days, Last 31 Days, Last 12 Months,
 Current Billing Cycle, or Last Billing Cycle for partners. You can also select Custom to enter a specific date range.

The Usage graph appears below and shows the total request number, the number of successful API calls, and the number of errors based on the search parameters you defined.

If there are errors, the error codes and the total number for each error code appear in a table below the graph.

Viewing Analytics from the Applications Analytics Tab

This provides a view of usage analytics at an application level.

- 1. Open the Developer Portal and click the **Applications** tab.
- 2. Search for an application and click the View details link for it.
- 3. Click the **Analytics** tab.
- 4. Optionally choose search parameters to narrow results to specific hotel(s), environment type(s), organization(s), API(s), and date range:
 - **x-hotelids**: Enter the OPERA property ID of one or more hotels. This was sent in the x-hotelid header of the API request.
 - Call Type: Select either REST or Streaming for the call type. Alternatively, you can select All, which provides analytics for both REST and Streaming combined.
 - Environment Type: Select All, Non Production, or Production for your environment type. This selection is determined based on the environment being called, either a non production or production instance.
 - APIs: Select one or more API(s) from the list.

- **Organization**: Hoteliers can select whether to view their own analytics or those of one or more partner organization(s).
- Choose Range: Select a date range from which to view usage analytics. You can select Last 24 Hours, Last 7 Days, Last 31 Days, Last 12 Months, Current Billing Cycle, or Last Billing Cycle for partners. You can also select Custom to enter a specific date range.

The Usage graph appears below and shows the total request number, the number of successful API calls, and the number of errors based on the search parameters you defined.

If there are errors, the error codes and the total number for each error code appear in a table below the graph.

Downloading Analytics

- 1. Open the Developer Portal and click the **Applications** tab.
- 2. Search for an application and click the View details link for it.
- 3. Click the Analytics tab.
- 4. Click the **Download Report** button and click **Download** again to confirm.

This exports the report as a .csv file that you can open or save.

The download reflects dates and times in the UTC time zone.

8

Business Use Cases

Business Use Cases is a searchable page for finding business use case articles. On this page, you can search for a business use case and view detailed information about it to assist you when building your application. The business use case articles include helpful information, such as an overview, key terminology, sample workflows, and FAQs. The following business use case articles are available and more will be added in future releases:

- Blocks
- Business Events and Streaming
- Nor1 Upsell
- Payments
- Property Interface Posting Charges
- RMS Revenue Management Systems

9

Business Events

A business event is an event (that is, an update) that happens to a resource, for example, a reservation. Rather than GETting the reservation repeatedly, subscribing to the Update Reservation event will inform you when this or other reservations are changed. Oracle Hospitality systems emit Business Events in multiple scenarios, such as creating a new resource, updating a resource, or deleting a resource. Each business event has the following pieces of information:

- Resource This is the resource that has received the event (for example, a reservation).
- Event The name of the event, for example, an update to a reservation.
- Old value This is the old value for the field.
- New value This is the new value for the field.

There are two methods for consuming events from Oracle Hospitality APIs: Polling and Streaming.

For a list of business events and data elements, refer to the Configuring Business Events topic in the OPERA Cloud User Guide.

Streaming API (push)

Overview of Event Consumption via the Streaming API

When partners or customers consume business event data from OPERA Cloud, they can choose which events an application will receive. These are the events to which the application subscribes.

A partner or customer can subscribe to business events from a specific environment, but approval from the environment owner is required.

For more information on streaming, read our blog post.

Customer Approval for Partners

A customer Developer Portal user can only approve the sending of business events for hotels to which they have access.

Customers can log in to the Developer Portal and do the following:

- See a list of the partners who are requesting to consume events.
- View a list of events a partner is consuming and see from which hotels and environments the partner is consuming these events.
- Approve event consumption for one or many hotels in the requested environment.

Note:

In the following circumstances, the event subscription will automatically be approved.

- Partners consuming business events from the partner sandbox.
- Partners consuming business events from their dedicated non production environment.
- Customers consuming business events from their own non production environment.
- Customers consuming business events from their own production environment.

Customer - Enabling Streaming

To get started with their first environment, customers must purchase the OHIP Premium Remote Assistance SKU (B93152) to engage with Oracle Professional Services.

For subsequent environments, customers must raise a technical SR. The Technical SR must include the following details, which are found on the customer's **Environments** card in the OHIP developer portal:

- Customer Name The customer's name can be found on the hotelier's Environments card in the OHIP developer portal and appears before the brackets on the card.
- Customer Chain The customer chain to be accessed. This can be found on the hotelier's Environments card in the OHIP developer portal and appears after the brackets on the card.
- Environment Name This can be found on the hotelier's Environments card in the OHIP developer portal and appears in brackets on the card.
- Shared Security Domain This is the URL via which the integration user for the hotelier's environment was created.

Note:

Streaming is enabled at the chain level, so once enabled for a chain, you do not need to enable it at the hotel level.

Partner - Enabling Streaming

Partners can initiate their testing in the partner sandbox environment. To gain access, request this in the partner Slack community. Partners should complete a successful streaming test by confirming that their code correctly receives Business Events and does not encounter errors either from OHIP or from downstream systems. This is not an Oracle validation, but a necessary assurance for both the partner and the hotelier before the partner accesses a hotelier's environment.

Following a successful streaming test, partners must open a Technical SR if they wish to get a customer environment UAT or Production environment enabled for streaming. The Technical SR must include the following details, which are found on the customer's **Environments** card in the OHIP developer portal:

- **Customer Name** The customer's name can be found on the hotelier's **Environments** card in the OHIP developer portal and appears before the brackets on the card.
- Customer Chain The customer chain to be accessed. This can be found on the hotelier's Environments card in the OHIP developer portal and appears after the brackets on the card.
- **Environment Name** This can be found on the hotelier's **Environments** card in the OHIP developer portal and appears in brackets on the card.
- Shared Security Domain —This is the URL via which the integration user for the hotelier's environment was created.

Streaming is enabled at the chain level, so once enabled for a chain, you do not need to enable it at the hotel level.

Partners must also ensure approvals have been obtained for the events they have configured on the customer environment. Customers can grant access to consume events within their developer portal.

Working with Events in the Developer Portal

Prerequisites for Consuming Events

- You must first add an OPERA environment from which to consume events before adding and subscribing to events.
- The OPERA environment must either have streaming enabled (see Streaming API) or have polling configured (see Configuring the Polling Subscription).

For information on working with business events in OPERA Cloud, refer to the Configuring Business Events topic in the OPERA Cloud User Guide. This topic also provides a list of business events and data elements.

Creating a Template of Events for an Application

The event template represents the list of events a given integration will use. When subscribing to consume events from a given OPERA environment, the template is a faster way to ensure the correct list of events is subscribed.

Before subscribing to consume events from a given OPERA environment, you must first create a template for the integration.

The template can be edited at any time. For example, your integration might change, and it now needs to consumer more events or fewer events.

Note:

Changes made on the template do not affect existing subscriptions to OPERA environments but will take effect when subscribing to new OPERA environments.

To configure the template events, complete the following steps:

- 1. Open the Developer Portal and click the **Applications** tab.
- 2. Search for and click an application to open it.
- 3. Click the **Events** tab.
- 4. Click **Add Event to Template** and complete the following information:
 - **a. Category**: Select a category for the event, such as Reservation.
 - **b. Event**: Select an event for the category, such as Check In.

Note:

To remove an event from the template, click the **Remove** link.

- 5. Click **Add** to add the event to the template.
- 6. Repeat these steps to add additional events to the template.

Once you have configured all the events your integration requires, click the **Subscribed** tab and choose any OPERA environment(s) from which to consume these events.

Subscribing to Events

A partner can subscribe to business events from a customer. Subscriptions to business events are specific to each application.

Use the Subscribe tab to subscribe to the list of events that you added on the Template tab.

- 1. Open the Developer Portal and click the **Applications** tab.
- 2. Search for and click an application to open it.
- 3. Click the **Events** tab.
- 4. Click the Subscribed tab.
- 5. Click the Subscribe link.
- 6. Select an Environment and click Subscribe.
- As a customer subscribing to events from your environment, select which hotels will consume the events.

The subscribed to event will be in a 'Pending Approval' status.

Note:

Only OPERA environments enabled for streaming appear in the list of environments.

Unsubscribing from Events

Once events are approved, you can unsubscribe from them as needed.

Note:

Unsubscribing from events on the Subscribe tab does not affect the events that appear on the Template tab. Also, changes made to events on the Template tab do not affect event subscriptions.

- 1. Open the Developer Portal and click the **Applications** tab.
- 2. Search for and click an application to open it.
- 3. Click the Events tab.
- 4. Click the Subscribed tab.
- Under Event Subscriptions, locate the event and click the green arrow to expand it and then click Unsubscribe.

Approving Events

A customer with Developer Portal access can approve the consumption of events from a specific environment. The customer can approve a partner's request to consume events before any events are sent to the partner. This enables customers to protect their data.

- 1. Open the Developer Portal and click the **Applications** tab.
- 2. Search for and click an application to open it.
- 3. Click the Partner Applications tab.

Note:

Applications with pending event subscriptions appear with a red ribbon icon on the application card.

- 4. Click an application with a pending event to open it.
- 5. Click the **Events** tab.
- 6. Click **Next** to proceed with approval.
- 7. Select the properties for the event subscription and click **Next**.
- 8. Click Approve.

The event status changes to 'In Progress' and then to 'Approved' status. The partner can see this status in the Developer Portal.

Rejecting Events

- 1. Open the Developer Portal and click the **Applications** tab.
- 2. Search for and click an application to open it.
- 3. Click the Partner Applications tab.
- 4. Click an application with a pending event to open it.
- 5. Click the **Events** tab.
- 6. Click **Reject** to reject the subscription.

The event status changes to 'In Progress' and then to 'Rejected' status. The partner can see this status in the Developer Portal.

Revoking Events

As a customer, if you no longer want a partner to consume events from your chain, deselect all hotels on the partner's application:

- 1. Open the Developer Portal and click the **Applications** tab.
- 2. Search for and click an application to open it.
- 3. Click the Partner Applications tab.
- 4. Click an application with a pending event to open it.
- 5. Click the **Events** tab.
- 6. Click **Edit** next to the list of hotels.
- 7. Deselect all the hotels.
- 8. Click Save.

Adding Events to Existing Subscription

To add events to an existing approved subscription:

- 1. Add the events on the Template tab (see the 'Creating a Template of Events for an Application' procedure above).
- 2. Subscribe again to consume events from the same environment (see the 'Subscribing to Events' procedure above).

Adding Hotels to an Existing Subscription

A customer with Developer Portal access can adjust an existing approved subscription to consume events from different hotels.

- 1. Open the customer or partner application.
- 2. Go to the Events tab.
- Click Edit next to the list of hotels.
- 4. Select the hotels that can consume the events.
- 5. Click Save.

Broken Connections

To avoid missing messages, you should keep the WebSocket connected. However, interrupted connections do occur, so OHIP retains a record of the last message sent to each connection as well as up to 7 days of messages. If the WebSocket gets disconnected, reconnect as described in the Authentication message. OHIP will then send any messages that have occurred since the disconnection occurred. For example:

Note:

OHIP holds the last offset for 24 hours only. If you do not reconnect within 24 hours, you must send the offset in the subscribe message that reflects the last offset you received.

Table 9-1 How the Streaming API works around broken connections

Oracle Hospitality System Emits Offset	OHIP Sends Partner Offset	Partner Receives Offset
191	191	191
192	192	192
193	193	193
194		Connection broken
195		Connection broken
196		Connection broken
	194	Connection re-established
	195	194
	196	195
		196
197	197	197

If the WebSocket remains disconnected for over 7 days, this might result in missed messages. Refer to the following table for examples.

Table 9-2 How the Streaming API stores and replays 7 days of events

Day	Oracle Hospitality System Emits Offset	OHIP Sends Partner Offset	Partner Receives Offset
1	191	191	191
1	192	192	192
1	193	193	193
2	194 to 317		Connection disconnected for day 1
3	318 to 520		Connection disconnected for day 2

Table 9-2 (Cont.) How the Streaming API stores and replays 7 days of events

Day	Oracle Hospitality System Emits Offset	OHIP Sends Partner Offset	Partner Receives Offset
4	521 to 701		Connection disconnected for day 3
5	702 to 929		Connection disconnected for day 4
6	930 to 1027		Connection disconnected for day 5
7	1028 to 1240		Connection disconnected for day 6
8	1241 to 1403		Connection disconnected for day 7
9	1404 to 1581		Connection disconnected for day 8
10	1582 to 1826		Connection disconnected for day 9
11		521 to 1826	Connection re- established
			521 to 1826
11	1827	1827	1827

In this example, messages 194 to 521 are missed and it is not possible to replay them.

Replaying Messages

The OHIP schema includes the metadata attribute "offset," which is the message number.

To replay messages already received, specify the offset value following the chainCode. For example in Postman:

In GraphiQL add the offset parameter after the chainCode. For example:

```
subscription{
  newEvent(input:{chainCode: \"<CHAIN CODE>\" offset: \"<OFFSET>\"}) {
```

```
moduleName
  eventName
  detail{
    newValue
    oldValue
    elementName
  }
  metadata{
    offset
    uniqueEventId
  }
}
```

OHIP sends event 193 and all events that occurred after event 193.

As noted in Broken Connections, if offset 193 was emitted more than 7 days ago, OHIP will return all messages emitted since 7 days ago. This is because OHIP retains events for only 7 days.

Interpreting the Event

Determining Changes

Three key fields are used to determine what has changed:

- elementName
- oldValue
- newValue

New Records

When receiving the record of a new Reservation, the payload will include the following for each field in the Reservation:

```
{
   "elementName": "First Name",
   "newValue": "NewFirstName"
   "oldValue": null
}
```

Note:

For the polling API, the "oldValue" will not be in the payload.

Updated Records

The following scenarios reflect when a record is updated and a field is changed:

1. If a field was blank before the update,

The polling API returns:

```
{
  "dataElement": "First Name",
  "newValue": "NewFirstName",
}
```

The streaming API returns:

```
{
   "elementName": "First Name",
   "newValue": "NewFirstName",
   "oldValue": ""
}
```

2. If the field is updated with a blank value,

The polling API returns:

```
{
  "dataElement": "First Name",
  "oldValue": "TheOldFirstNameValue"
}
```

The streaming API returns:

```
{
   "elementName": "First Name",
   "newValue": "",
   "oldValue": "OldFirstName"
}
```

3. If the field was not changed during this event,

The polling API returns:

```
{
   "elementName": "First Name",
   "newValue": "MyFirstName",
   "oldValue": "MyFirstName"
}
```

By default, the streaming API returns the same fields. However, if the "delta" input variable is set to true, the streaming API returns only fields whose value has changed. In this scenario, the elementName "First Name" would not be sent by the streaming API.

Removed Fields

If a field has been removed, this is reflected as:

```
{
   "elementName": "First Name",
```

```
"oldValue": "OldFirstNameValue"
}
```

Retrieving Unchanged Fields

As you can see in Updated records, if a field remains unchanged neither the "oldValue" nor "newValue" is sent. To retrieve the current (unchanged) value, make a GET call to the resource using the "primaryKey" field that is sent in the event payload. For example, if the event is UPDATE RESERVATION, the primaryKey will be a reservationId, so the full resource can be obtained using the getReservation API.

Comparing the Event Payload from Polling and Streaming APIs

Polling API Business Event payload

```
{
    "businessEventData": [
            "businessEvent": {
                "header": {
                     "moduleName": "Reservation",
                    "actionType": "NEW RESERVATION",
                     "actionId": "1234567",
                    "primaryKey": "987654",
                     "publisherId": "15951",
                    "createdDateTime": "2021-06-03 16:45:48.0",
                     "hotelId": "ABC123"
                },
                "detail": [
                         "dataElement": "FIRST NAME"
                     },
                         "dataElement": "CONFIRMATION NO",
                         "newValue": "123456789"
                ]
            },
            "businessEventId": {
                "id": "1234567"
            }
        }
    ]
}
```

Streaming API Business Event payload

```
{
  "data": {
    "newEvent": {
        "metadata": {
            "offset": 100,
            "uniqueEventId": "0ed06ced-843e-4e35-86ec-e2564cf495ee"
        },
```

```
"moduleName": "Reservation",
    "eventName": "NEW RESERVATION",
    "primaryKey": "123456",
    "timestamp": "2021-06-03 16:45:48.000",
    "hotelId": "ABC123",
    "publisherId": "15951",
    "actionInstanceId": "222222",
    "detail": [
        "newValue": "NewFirstNameValue",
        "oldValue": "",
        "elementName": "FIRST NAME",
        "scopeFrom": "",
        "scopeTo": "",
        "elementType": null,
        "elementRole": null,
        "elementSequence": null
      },
        "newValue": "123456789",
        "oldValue": "",
        "elementName": "CONFIRMATION NO",
        "scopeFrom": "",
        "scopeTo": "",
        "elementType": null,
        "elementRole": null,
        "elementSequence": null
    ]
  }
}
```

Table 9-3 Comparing Fields in the Polling and Streaming APIs

Section	Field Name in Polling	Section	Field Name in Streaming	Use
Header	moduleName	Event Header	moduleName	Grouping of events, useful guide to which API to use if unchanged data are needed.
Header	actionType	Event Header	eventName	Name of the event that occurred.
Header	actionId			Number of the event emitted from OPERA.
		Event Header	actionInstanceI d	Number of the event emitted from OPERA.

Table 9-3 (Cont.) Comparing Fields in the Polling and Streaming APIs

Section	Field Name in Polling	Section	Field Name in Streaming	Use
Header	primaryKey	Event Header	primaryKey	OPERA internal ID of the resource on which the event occurred. For example, an UPDATE RESERVATION event occurs on a reservation resource, so the primaryKey is the reservationId.
Header	parentActionId			
Header	publisherId	Event Header	publisherId	User reference Id of the user who created the transaction in OPERA.
Header	createdDateTim e	Event Header	timestamp	Date and time the event occurred.
Header	hotelId	Event Header	hotelId	OPERA internal Id of the hotel in which the event occurred.
		Subscription	chainCode	OPERA Shared Security Domain organization code within which the event occurred.
		Metadata	offset	Offset number of the event emitted from OHIP.
		Metadata	uniqueEventId	Unique identifier for the event emitted from OHIP.
Detail	dataElement	Detail	elementName	Name of the field that changed.

Table 9-3 (Cont.) Comparing Fields in the Polling and Streaming APIs

Section	Field Name in Polling	Section	Field Name in Streaming	Use
Detail	oldValue	Detail	oldValue	Old value of the field that changed (see notes in the 'Determining Changes' section)
Detail	newValue	Detail	newValue	New value of the field that changed (see notes in the 'Determining Changes' section)
Detail	scopeFrom	Detail	scopeFrom	Beginning of the data range for which the business event is valid. For example, if a rate code or rate amount is different for different stay dates and the rate is updated, the scopeFrom determines the start of the stay date range that was updated.
Detail	scopeTo	Detail	scopeTo	End of the data range for which the business event is valid. For example, if a rate code or rate amount is different for different stay dates and the rate is updated, the scopeTo determines the end of the stay date range that was updated.

Errors

All errors result in the connection being broken and require the below fixes before connecting again.

Table 9-4 Potential Streaming API Errors and Fixes

Error Returned	How does this Happen?	How to Fix	Error Type
429 Too Many Requests	Sending more than 150 requests to upgrade to WebSocket and sending the requests within 2 minutes from the same application.	Retry after 2 minutes.	НТТР
499	The client disconnected before the server was able to send a response to the initial HTTP upgrade, so the WebSocket was not opened.	Ensure your calling architecture is leaving the connection open long enough for the server to reply.	НТТР
1000 Normal Closure	The WebSocket was disconnected by the caller	Reconnect from the Authentication message.	WebSocket
1001 Going Away: Going away	Maintenance by Oracle	Reconnect from the Authentication message.	WebSocket
1006 Abnormal Closure: Abnormal Closure	Connection broken	Wait 4 seconds and then reconnect from the Authentication message.	WebSocket
Error: Unexpected server response: 400	Incorrect key or URL	 Check the sha256 hash of the application key is correct. Check that the application key is subscribed to consume events and that the event subscription is approved. Check the URL matches the environment listed in the Developer Portal. Check that the environment is Streaming Enabled. 	HTTP

Table 9-4 (Cont.) Potential Streaming API Errors and Fixes

Error Returned	How does this Happen?	How to Fix	Error Type
4400 Error: Bad Request - Invalid GraphQL Subscription	Invalid field in subscription message	 Check the response body which includes details of the invalid field. For example, "Cannot query field XYZ on type ABC" or "Value for <field> is invalid - Expected ABC to match pattern ZYZ."</field> Check that the fields in the subscription request match the OHIP schema Github link. Reconnect from the Authentication message. 	WebSocket
4401 Error: Unauthorised - Invalid credentials	Invalid credentials sent in the Authentication message	 Check you are sending the application key, not the sha256 hash of the application key. Check that the application is subscribed to consume events and that the event subscription is approved. Check that the oAuth token is valid and current. 	WebSocket

Table 9-4 (Cont.) Potential Streaming API Errors and Fixes

Error Returned	How does this Happen?	How to Fix	Error Type
4403 Error: Forbidden - You are not authorized to access this resource	Invalid chainCode in subscription message	 Check that the chain code in the subscription message matches the chain code being accessed. This is the value at the start of the integration that the user sent to obtain the oAuth token. Check that streaming is enabled for the environment you are accessing Reconnect from the Authentication message. 	WebSocket
4406 Error: Subprotocol not acceptable	Failing to include the WebSocket protocol header.	Include the header "Sec-WebSocket- Protocol: graphql- transport-ws"	WebSocket
4408 Error: Disconnect	Connection initialization time out	Send the Authentication message within 5 seconds of opening the connection.	WebSocket

Table 9-4 (Cont.) Potential Streaming API Errors and Fixes

Error Returned	How does this Happen?	How to Fix	Error Type
4409 Too Many Requests	More than one client or process is trying to consume events from the same gateway using the same application key and chain code. This often happens in the following circumstances:	consumes events from a given gateway using a given application key and chain code. Ensure that you send	WebSocket
	1. When consuming events in code ar in Postman/ GraphiQL.		
	2. Where multiple developers are trying to consum events from a single application		
	3. Where an application has spawned additional thread all consuming events from the same gateway, application key, and chain code.	ls	
	4. When disconnecting without sending the Complete message.		
1429 Error: Too Many Requests	Resending the subscription message when the connection is already open Resending the connection_init message when the connection is already open	open, so it cannot be reopened. Look for the connection_ack message and do not resend connection_init	
4500 Server Error - No configuration found. If this problem persists, contact Oracle Customer Support at the Customer Support Portal.		Check that the application is subscribed to events and shows as approved for that environment.	WebSocket

Table 9-4 (Cont.) Potential Streaming API Errors and Fixes

Error Returned	How does this Happen?	How to Fix	Error Type
4500 Unable to find configuration between Application, Chain, and Environment. Please ensure your application has access. If this problem persists, contact Oracle Customer Support at the Customer Support Portal.	A piece of internal configuration might be missing.	Ensure your application is approved to consume events and that the URL you are calling is a streaming enabled gateway. If the problem persists, contact Oracle Customer Support at the Customer Support Portal.	WebSocket
4500 Internal Server Error received 6 minutes after sending the subscribe message.	When subscribing, the consuming application should wait up to 6 minutes before receiving any events. If the subscription is valid and an internal issue has occurred, this message is received 6 minutes after sending the subscribe message.	Reconnect and send the Authentication message and then send the Subscription message.	WebSocket
4501 Socket closed with error 4501 Not Supported Environment for subscriptions	Connecting to an environment that does not support streaming Business Events.	Ensure the environment shows as "Streaming Enabled" on the Environments tab of the developer portal. Streaming Business Events from OPERA requires a minimum of OPERA Cloud version 22.3.0.1.	WebSocket
4504 Socket closed with error 4504 Service Timeout	This error occurs when the OCI Streaming Service goes down for more than 30 seconds.	Try again after 15 seconds. If this problem persists, contact Oracle Customer Support at the Customer Support Portal.	Websocket

Connecting to the Streaming API

Overview

The streaming API is built on <u>GraphQL over WebSocket protocol</u>. This protocol defines that a given stream (identified by application key, URL, and chainCode) can only be consumed by one application/process/thread. Therefore, do not use multithreading when connecting to the Streaming API.

Prerequisites

Streaming Business Events from OPERA Cloud requires a minimum version of OPERA Cloud 22.3.0.1.

Before connecting to consume Business Events from the WebSocket, verify the following prerequisites are met:

- Onboard to OHIP by following the steps in Getting Started for Partners.
- Create an application by following the steps in Registering an Application.
- Take a note of the application key.

Note:

It is important that you write down the application key.

You can only connect to the streaming API from one application at a time using the same application key. Using a single application key to simultaneously access the API from multiple applications will stop the streaming service.

- Add an environment from which to consume events. For more information, see Environments (Gateways and Credentials). Take note of the following:
 - ClientId and ClientSecret These are needed to obtain the oAuth token.
 - Gateway URL
- Check that the environment is streaming enabled. It will have a label "Streaming Enabled" if this is the case.
- Set up the template of events. For more information, see Working with Events and Creating a Template of Events for an Application.
- Subscribe to consume the events from an environment. For more information, see Working with Events and Subscribing to Events.

If the environment is the partner sandbox or an environment owned by your organization, the request to consume events is automatically approved. If not, environment owners (usually customers) must approve the request to consume events from their environment. To do this, following the process in Working with Events and Approving Events.

Once the request to consume events is approved, the event is listed as "Approved" on the Developer Portal.

GraphQL

The streaming API uses GraphQL subscriptions delivered via WebSocket. To learn more about this technology, read our blog post.

WebSocket Authorization

Access to the streaming API is protected by oAuth and an application key. The application key comes from the application you created in Registering an Application.

To obtain the oAuth token, follow the processes described in Using the Oracle Hospitality APIs and in Authenticating to Oracle Hospitality Property APIs. For an example of the oAuth token, visit the Get OAuth Token page on the Postman API Platform site at https://www.postman.com/hospitalityapis/workspace/oracle-hospitality-apis/request/15729853-58d0804e-b607-4c37-bf2f-0656c254573c.

Information required to call the WebSocket

To connect to the streaming API, the following pieces of information are required:

- Application Key (Create an application by following the steps in Registering an Application.)
- Valid oAuth Token
- URL

Note:

If the URL listed on the Environment panel in the Developer Portal is "https://www.oracle.com," the URL for the streaming API should be "wss://www.oracle.com/subscriptions." The change from "https" to "wss" is required for connection via WebSocket.

Browsing the OHIP Schema

The Documentation Explorer is located on the right-side of the screen.

- Click the Subscription link to browse the schema for creating the subscription.
 The Subscription object requires you to specify a "NewEventInput" object containing the chainCode and the offset.
- Click NewEventInput to view the data type and limits on these fields.
- Click the Subscription arrow to go back to the definition of the Subscription object.Returned in the response to this subscription is the type called "EventHeader."
- Click the EventHeader to view details of the fields that can be returned (if included in the query).
- 5. Click any of these fields to see the object definition, data types, and limits on the fields. One of the response fields is the "detail" array, which includes fields such as newValue, oldValue, and elementName (that is, the name of the data element that changed).
- **6.** Compose your GraphQL query using the left-side of the screen, which includes intellisense to speed up the completion of the query.
- 7. Click Start to open the WebSocket connection. Any events meeting the subscription configured in the Developer Portal are sent and appear on the right-side of the screen, but include only those fields specified in the subscription query on the left-side of the screen.
 - The right-side of the screen only shows the latest event. Since many events will be sent at once, use the developer tools in the browser to view the full list of sent events.
- 8. Click **Stop** to disconnect the WebSocket.

Note:

When the Auth Token expires, the connection must be severed and then reestablished with a fresh Auth Token every hour.

Connecting to the Streaming API via GraphiQL

To better visualize the streaming API, a playground application is available that uses a tool called GraphiQL. The GraphiQL tool is often utilized with GraphQL APIs. It is available as a standalone web page from our public Github repository.

Note:

The GraphiQL page has a limitation that a single browser can only stream events from one application at a time. GraphiQL cannot be open in multiple tabs or windows consuming events from different applications.

Connecting via GraphiQL

- Enter the URL (see the 'Information required to call the WebSocket' section in WebSocket Authorization).
- 2. Enter an Auth Token as described in WebSocket Authorization.
- Enter the API key as it is listed in the Developer Portal.

This is the not the sha256 hash of the API key.

- Click the Start button.
 - This stores the values on your machine not on the server. Only you can view these saved values.
 - This populates the Socket Key.

The connection is open if you see the three boxes appear below the Start button.

- The left-hand box holds the subscription request. By default, this includes a
 getHelp query and an example subscription.
- The middle box holds the latest response.
- The right-hand box is a navigable representation of the GraphQL schema showing the fields you can include in the subscription.

Since the middle box holds only the latest response, you should open developer tools in your browser, usually the Network tab, so that all events sent on the stream are visible.

- 5. Click the **play** button to open the WebSocket connection. By default, this returns the getHelp query with useful links to this guide.
- **6.** Comment out the getHelp query and remove the comments in front of the example subscription.

Use **CTRL** + *I* to comment or uncomment.

- Optionally, add elements from the GraphQL schema into the subscription. Press CTRL + space to list fields from the schema.
- 8. Click the play button to open the WebSocket connection. All events that occurred after the subscription was approved are now sent with the latest event shown in the middle pane. The WebSocket connection remains open until you click the stop button. This means if any of the events chosen in the Developer Portal occur in the subscribed hotel(s), the events are immediately sent on the streaming API and appear in the middle pane.

Note:

When the Auth Token expires, the connection must be severed by clicking the stop button and then reestablished with a fresh Auth Token every hour. As noted in the Broken Connections topic, OHIP sends any events that occurred between stopping and restarting the WebSocket connection.

Viewing Historic Events

To view historic events, use your web browser's developer tools. For example:

- 1. In Mozilla Firefox, press F12 to open developer tools.
- 2. Click the **Network** tab.
- Click WS to show only WebSocket requests.
- 4. After clicking the play button, click the last web service request sent.
- 5. When the details appear, click the **Response** tab.

You will see all the sent business events. You can view each business event inside the developer tools by clicking it, or you can copy it by right clicking the business event in the list of responses and clicking **Copy Message**.

Connecting to the Streaming API with Postman

Postman can be accessed online or from the Postman API Client https://www.postman.com/product/api-client/. You must be signed in to a Postman workspace to use WebSocket APIs in Postman.

Note:

While it is possible to support WebSocket via Postman, it is not yet possible to save WebSocket requests in Postman except while signed in to a Postman workspace.

You can connect to a given stream from only one application and thread at a time. Ensure the stream (identified by the application key, URL, and chainCode) is not being used by any other applications.

Postman does not support the sending of a ping, so any postman connection closes after 5 minutes.

Complete these steps to consume events in Postman version 8.12.4:

- 1. Select New and then select WebSocket Request.
- 2. Enter the URL in the following format: wss://www.oracle.com/subscriptions as described in "Information required to call the WebSocket."
- 3. Add the query parameter (see the 'Query Parameters' section).
- 4. Add the headers (see the 'Headers' section).
- 5. Send the Authentication message.
- 6. Send the subscription message within 10 seconds of the Authentication message.
- 7. View the events returned.

Query Parameters

The GraphQL subscription resource has one mandatory query parameter named "key." The value is a sha256 hash of the application key obtained from Registering an Application.

If LINUX environments are running, echo-n ABC-123 | sha256sum (where "ABC-123" is the application key) will return the required hash. In Microsoft Windows environments, use a code snippet or download GitBash or Windows Subsystem for Linux. To run this command, visit the Install WSL page on the Microsoft website at https://docs.microsoft.com/en-us/windows/wsl/install. Alternatively, you can use an online sha256 hash generator.

Ensure only lowercase hashes are used.

To add this to Postman:

- 1. In Postman, click the Params tab
- 2. In the first column, enter the value "key."
- 3. In the second column, enter the value of the 256 hash that was calculated above.

Headers

The Oracle Hospitality streaming API uses the GraphQL-WS protcol passed in headers:

- 1. In Postman, click the **Headers** tab.
- 2. In the first column. enter the value "Sec-WebSocket-Protocol."
- 3. In the second column, enter the value "graphql-transport-ws."

ID

All messages, except the "ping" message (see Keeping the Stream Open), require you to specify an ID in the request payload.

The ID should be a GUID to avoid collision with other consumers.

The same ID value must be used throughout a stream's life.

Authentication Message

Send the authentication "Connection Initialization" message before sending the subscription message.

1. In Postman, click the area marked **New Message** and enter the following:

```
{
  "id": "<GUID>"
  "type": "connection_init",
  "payload": {
      "Authorization": "Bearer <OAUTH TOKEN>
      "x-app-key": "<APPLICATION KEY>"
  }
}
```

Where:

- oAuth Token is the access_token returned from the oAuth request. For more information, see Web Socket Authorization.
- APPLICATION KEY is the application key from Registering an Application.

Once the authentication message is successfully received, the following "Connection Acknowledged" message is returned:

Where APPLICATION NAME is the name of the application that corresponds to the application key. This validates that the correct application is being used.

In Postman, the connection will show as "CONNECTED."

Subscription Message

- 1. Send the subscription message within the next 10 seconds now that the connection is authenticated and connected.
- 2. In Postman, overwrite the Authentication message request body with the following request body:

```
{
    "id": "<GUID>",
    "type": "subscribe",
    "payload": {
        "variables": {},
        "extensions": {},
        "operationName": null,
        "query": "subscription { newEvent(input: { chainCode:
    \"OHIPCN\" }) { metadata { offset } moduleName eventName detail
{ oldValue newValue elementName } } }"
```

```
}
```

The "query" is the GraphQL query formatted against the OHIP schema. It contains the fields to be returned along with business events.

- 3. For the chainCode, specify the "tenant" entered when creating the integration user. Refer to step 1 in Authenticating to Oracle Hospitality Property APIs. This is also prefixed on your integration username.
- 4. Click the **Send** button.

Viewing the Events Returned

In Postman, messages from the server begin with a down arrow.

To see the JSON response payload:

Click to expand the message.

The payload includes only those elements from the "query" specified in the Subscription message.

When multiple events are pending subscription, each event is returned in sequence.

Keeping the Stream Open

To keep the connection open, you must send a "ping" request at least every 15 seconds on the WebSocket (see the below JSON example).

```
{"type":"ping"}
```

You are not charged for this "ping" request.

An example implementation is listed on GitHub in the Recipes section under 'Client usage with ping/pong timeout and latency metrics.'

Updating Authentication

The streaming API is secured by an oAuth token whose life is limited to one hour (sixty minutes). To continue receiving events, you must keep the stream open by doing the following:

- 1. Close the WebSocket (see Disconnecting the WebSocket for more information).
- Request a new oAuth token from the oAuth API.
- Reopen the websocket and specify the new "access_token" received from the oAuth API.

Disconnecting the WebSocket

WebSockets are designed to stay open. When planning to disconnect from a WebSocket (refer to the Broken Connections topic), be aware of the following:

- Events will queue up while disconnected, but only 7 days of events are retained. This can be a large volume of events, so before reconnecting, verify your consuming architecture can support the volume.
- Send the "Complete" message (see the example below).

Sending the Complete Message

Before disconnecting, ensure you send the below Complete message (see the protocol for more information):

```
"id": "<GUID>",
    "type": "complete"
}
```

You must send the Complete message to connect to the stream (identified by the application key, URL, and chainCode). Failure to send the Complete message will make it impossible to connect to the stream. If a subscribe message is sent to a stream that has not yet received a complete message, a 4409 error will occur.

Reconnecting after Complete

Ensure there is a minimum of 500 ms between sending the "Complete" message to close a WebSocket connection and sending the next "Subscribe" message to reopen a WebSocket connection.

Streaming Best Practices

You must connect to the WebSocket at least once every 24 hours. If not, then you must send the optional "offset" input parameter together with the value of the last offset you received.

Ensure there is a minimum of 500 ms between sending the "complete" message to close one WebSocket connection and the next "subscribe" message to reopen a WebSocket connection.

The Streaming API is not throttled. As events are produced, they are immediately sent out. Potentially, this means many events will be pushed at the same time and create a backpressure.

To cope with this potential backpressure, it is essential the consuming architecture can scale, for example, by buffering before writing to back-end systems. If the backpressure exceeds the ability of the consuming architecture to scale, you can disconnect the WebSocket and

then restart it later once more capacity is available in the consuming architecture. Any events that occurred since the WebSocket disconnect will be sent as soon as you reconnect.

No option is currently available to clear the backlog of events, and you must continue to process those events. Alternatively, you can create a new application and delete the old one if it is not required.

Streaming Troubleshooting

If you are experiencing issues consuming the Streaming API, check the following:

Environment

- Verify the OPERA environment from which you wish to stream events is listed on the Environments tab of the developer portal.
- Verify the OPERA environment shows as Streaming Enabled on the Environments tab of the developer portal.
- Verify you have valid credentials to obtain the oAuth token (see API Troubleshooting for more information).
- Verify the oAuth token is current. They expire after 60 minutes. If not, request a new oAuth token. Check the oAuth token is current. They expire after 60 minutes. If not, request a new oAuth token.

Configuration

Ensure your application streaming configuration is both requested and approved (see Working with Events in the Developer Portal for more information).

Postman

Postman cannot send "ping" on an open WebSocket, so the connection will automatically close. When it closes, you must resend the "init" message and then resend the "subscribe" message.

It is not yet possible to save WebSocket requests in Postman, except when signed in to a Postman workspace.

GraphiQL

If you receive errors from GraphiQL, ensure you have it opened only once. It cannot support streaming events from different applications in different tabs (see Connecting to the Streaming API via GraphiQL for more information).

Not Receiving the Expected Data

If you are not receiving the pieces of data you expected, check the subscribe message to ensure it includes the expected field.

The hotelld will always be null for chain-level entities, such as profiles, which tend to be shared across all hotels in the chain.

Verify this page lists the expected data values for the event(s) to which you are subscribed (see the 'Business Events - Activity' heading under the Configuring Business Events topic in the OPERA Cloud User Guide).

Receiving Unexpected Events

Keep in mind that a single action, such as checking a guest in, can trigger multiple business event notifications because that single action modifies multiple resources.

For integration partners developing against the sandbox, keep in mind that the actions taken by other partners in the sandbox will generate events.

Not Receiving Expected Events

If you are not receiving all new reservations, it is possible the customer has an external CRS setup. Request the customer to set up a "publisher" on your external system (the external system code is displayed on the **Application**, **Events**, **Subscribed** tab in the developer portal) following this process (see the 'Managing External System Publishers' heading under the Configuring External Systems topic in the OPERA Cloud User Guide).

If you are not receiving any events, it is possible you have not connected for greater than 24 hours. In this case, stop the WebSocket and reopen it, specifying in the subscribe message the last offset you received.

Verify you are not unexpectedly using the "hotelId" filter in the subscribe message.

Getting Overwhelmed with Events

The Streaming API sends events as soon as they are available, so it is important that consuming architecture can scale and potentially buffer events to avoid choking database connections (see Streaming Best Practices for more information).

Other Errors

See the Errors topic for suggested resolutions to common errors.

If the "init" request is failing, ensure you send it within 5 seconds of the HTTP upgrade request.

If the connection keep closing:

- Ensure you send "ping" every 15 seconds (see Keeping the Stream Open for more information).
- Postman cannot send "ping," so the connection will automatically close.
- Wait at least 500ms between closing and re-opening the WebSocket, or you will receive 4409 errors (see Disconnecting the WebSocket for more information).
- Ensure that only one process/thread/user is connected to a given stream (identified by application key, URL, and chainCode) at any one time.
- Ensure you have connected only one WebSocket per application: Connecting more than one WebSocket with the same application key will result in 4409 errors.
- If the socket closes with a 4401 error, obtain a new oAuth token before reconnecting. The socket will automatically close every one hour when the oAuth token expires (see Keeping the Stream Open for more information).
- Receiving a 4403 error:
 - Verify the chain to which you are subscribing in the subscribe message matches the chain for the integration user that was used in the oAuth request.
- Receiving a 4409 error:

- Ensure only one client or process consumes events from a given gateway using a given application key and chain code.
- Ensure you send the Complete message before disconnecting from the WebSocket.
- Ensure you send the ping message to keep the stream open (see Keeping the Stream Open for more information).
- Reconnect after 5 minutes.

Confused About Implementation?

We adhere to the GraphQL over WebSocket protocol, so ensure your implementation meets this protocol.

An example implementation is available on this GitHub page.

It is suggested that you create a second application using the GraphiQL tool to better distinguish between implementation and configuration issues.

Polling API (pull)

To consume business events generated in OPERA Cloud using the polling APIs, visit OPERA Cloud Integration Processor API and follow the instructions.

Prerequisites

- The customer must be onboarded to consume Business Events via OHIP. For more information, see Getting Started.
- OPERA Cloud properties on OPERA Cloud version 21.2.1+ can configure
 Business Events in OPERA Cloud without impediment. If an OPERA Cloud
 property is below version 21.2.1, the customer can raise a Service Request to
 apply the OPP_BSEV license without cost, which enables them to configure
 Business Events.

You can discover your OPERA Cloud version using the following API call:

https://www.postman.com/hospitalityapis/workspace/oracle-hospitality-apis/request/15729853-8dca939b-a6b5-4dca-bc0f-663027d11a88

Configuring the Polling Subscription

The polling API requires the owner of the OPERA Cloud environment to configure the subscription in OPERA Cloud.

- Verify a chain-level user has the below tasks assigned. To assign these tasks, follow the steps in the Assigning Tasks to a Role topic in the OPERA Cloud User Guide.
 - a. Interfaces Admin Property Interfaces —External Systems:
 - New/Edit External Systems
 - b. Toolbox:
 - External Databases
 - c. Interfaces Admin Property Interfaces —Business Events:
 - New/Edit Business Events

2. Create an external system for your organization by following the steps in Configuring External Systems topic in the OPERA Cloud User Guide.

Make sure you remember the external system code you created.

- 3. Create an external database by following the steps in the Configuring External Databases topic in the OPERA Cloud User Guide.
- 4. Configure the chosen events on the external system by following the Configuring Business Events steps in the OPERA Cloud User Guide. For the list of events that can be consumed, see the Business Events Data Elements guide.

If there are challenges with this process, the owner of the OPERA Cloud environment should contact Oracle Customer Support at the Customer Support Portal, raise a Technical SR, and select Oracle Hospitality OPERA Cloud as the product.

5. Communicate or make note of the external system code created at step 2.

Consuming Business Events using the Polling API

- 1. Onboard to OHIP by following the steps in Getting Started for Hoteliers.
- 2. Create an application by following the steps in Registering an Application. Take a note of the application key.

Make sure you remember the application key.

- 3. Add an environment for the environment from which you need to consume events. For more information, see Environments (Gateways and Credentials). Take note of the following:
 - ClientId and ClientSecret These are needed to obtain the oAuth token.
 - Gateway URL
- 4. Determine the hotelld of the hotel from which to consume business events.
- 5. Call the FetchBusinessEvents API and specify the external system code as configured in the 'Configuring the Polling Subscription' task above.
- **6.** Specify the x-hotelld as the hotelld from step 4 above.

If the following response is received from the FetchBusinessEvents API, contact Oracle Customer Support at the Customer Support Portal to raise a technical Service Request quoting this error. (This is resolved in OPERA Cloud version 21.2.1.)

"shortText": "Failed to initialize <your external system code> interface for <hotelCode> resort: <your external system code> is not registered as an application user."

For information on how to interpret the event responses and for the differences between the polling and streaming APIs, see Interpreting the Event.

For more information on the polling API, watch OPERA Cloud Business Events.

10

Moving to Production

This chapter consists of two sections:

- **Hoteliers Moving to Production** This section explains how a hotelier would move their own integrations to Production once the development and testing phase is complete.
- Partners Moving to Production This section explains how a partner would move an application to Production once testing and development is complete (otherwise known as "activating an application with a customer chain"). In this scenario, all actions are on the Partner side within the Partner Organization Developer Portal, and the only action required by the customer (that is, OPERA Chain Administrator) is to approve the integration user submitted by the partner in the vendor registration portal. Customers will receive notice in their Shared Security Domain that a partner has requested access to their customer chain environment.

Hoteliers Moving to Production

- 1. Create and register an application. Ensure you choose "Production" as the environment.
- 2. Create an integration user.
- 3. View environment.
- 4. Call the APIs.

Partners Moving to Production

You only need to perform steps 1 to 3 on your first integration.

1. Join OPN. Please note that the minimum level required for OHIP is the OPN Member Level. For more information, visit How Do I Join Modern OPN?

- 2. Publish your app to the Marketplace. To publish your solution, visit Publish Services and Applications on the Oracle Cloud Marketplace and follow the steps on this page.
- 3. Contact us via Slack once your application is listed in the marketplace under the OHIP product category. If you're not part of the OHIP Slack Community, email us at hgbu_integrations_provisioning_grp@oracle.com to request your private channel.
- 4. Check the customer's environment by asking customers to verify they are running OPERA Cloud and have an active subscription for OPERA Cloud Foundation. Customers can verify this with their account manager if in doubt.
 - If you are using both Early Adopter (v0) and v1 APIS, you will need to subscribe your app to both.
 - If your solution involves calling Asynchronous APIs, contact Oracle Support to check if they are supported in the production environment being called. Include the OPERA Cloud URL or gateway URL in the support request.
- Create and register an application. Ensure you choose "Production" as the environment.
- 6. Create an integration user.
- 7. View environment.
- 8. Call the APIs.

FAQ

How do I know the customer has approved my integration?

You will receive an email with a subject line.

How do I know the URL for the vendor registration portal?

If you have not received this from customers, ask them for the URL with which they access OPERA Cloud.

11

Migrating from Legacy APIs to REST

Integrations with Oracle Hospitality products now utilize REST APIs exposed through Oracle Hospitality Integration Platform (OHIP). As there are many active integrations certified on our legacy integration products, such as OXI, OWS, ADS, HTNG, and Kiosk, this chapter will help Hoteliers and Partners understand the process to migrate an existing legacy interface to the new REST APIs.

In OHIP, we have the following Oracle Hospitality products:

- Property APIs (OPERA Cloud)
- Distribution APIs

Depending on your integration requirements, there are different scenarios for integrating with Property APIs versus Distribution APIs.

OPERA Xchange Interface (OXI)

The OXI Interface works on an asynchronous pattern which follows the below flow:

- 1. A message is sent from an external system to OXI.
- The message sits in a queue.
- 3. The message is processed.
- 4. A record is inserted or updated in OPERA Cloud.

Once processed, a response message is returned to the external system, and it again sits in a queue until processed. This same pattern occurs for messages being generated from OPERA Cloud to an external system. The REST APIs work on a synchronous pattern. Conforming to REST architecture, the APIs allow for interaction with RESTful web services.

The REST APIs use JSON formatting.

You can move your integration from OXI to REST and even enhance it as there is greater functionality available with the REST APIs.

OXI Outbound Messages

For messages sent from OPERA Cloud to an external application, the REST APIs utilize the same Business Event functionality as OXI. Therefore, the same data can be triggered from OPERA Cloud. There are two approaches available for use: polling for Business Events using getBusinessEvents operation or using streaming services. For more information on property Business Events available in OHIP, refer to the Business Events topic that explains both options in detail.

OXI Inbound Messages

Data from the external application to OPERA Cloud can be achieved using REST APIs. The below mapping table shows the OXI messages and shows the equivalent Property REST API to use.

Key Considerations

OXI can synchronize data between the two applications. For example, users could enter a date range of reservations, and a batch of resync messages are sent to the external system. This was often used when a hotel went live with a new interface, ensuring the external system had all the required data, including rates, inventory, restrictions, and so on. The REST Property APIs have Asynchronous APIs, which enable the user to send a REST request to OPERA Cloud for a significant amount of data (for example, 30 days of reservations). OPERA Cloud processes the request, collects all the data, and then allows the data to be fetched using the get request.

OXI provided the ability to map OPERA Cloud codes to external system codes, such as room type codes, rate codes, package codes, and so on. The REST APIs with OPERA Cloud no longer follow this approach, and codes must now be one to one. Alternatively, the external system would need to cater for mapping on their side and ensure that when posting a message to OPERA Cloud, the message contained the OPERA Cloud code(s).

OXI XML messages send a full object in XML format as opposed to business event messages (either pull or push approach), which send key value pairs in JSON format. You will receive a JSON message with the old value and the new value. For more information, see Interpreting the Event.

Rest APIs handle credit card data differently than OXI, which allowed tokenization of card data. With REST APIs, the consumer must perform a step to fetch the token from the Payment Service Provider (PSP) and then use that token in the reservation. This only applies to customers with OPI active.

HTNG

The legacy HTNG integration was most commonly used for Hoteliers and partners with activity management applications, such as spa and golf booking applications. It used the OPERA Electronic Distribution Systems (OEDS) integration and provided web services utilizing SOAP calls. The HTNG interface with OPERA used a combination of synchronous SOAP requests from the external system to OPERA as well as Business Events from OPERA to the external system. The Business Event functionality is still available when migrating to the REST APIs. Although the messages look a little different, the available data is still in REST format. For further information on Business Event functionality, refer to the Business Events topic.

The legacy HTNG interface also provided the ability for posting financial transactions to OPERA.

The below mapping table provides the suggested APIs to use when migrating from the legacy HTNG interface to the REST APIs available in OHIP.

Table 11-2 HTNG to REST

OPERA Web Services (OWS) and KIOSK

The legacy OWS and Kiosk interfaces use SOAP Web Services technologies to support data transfer from a client application to OPERA. The interface is commonly used for web booking engines and check-in applications, but it is also used for customer relationship management and membership functionality. While the legacy interfaces provide a lot of functionality,

migrating to the new REST API provides even more functionality for your integration to OPERA Cloud. Furthermore, the REST APIs also have an asynchronous interface just like OWS.

The below table provides suggested APIs and operations to use when migrating from legacy OWS/KIOSK interface to the REST APIs. However, there are a few operations currently not available in REST that are available in OWS. Management of membership functionality is not yet available.

Table 11-3 OWS to REST

Property Interfaces — IFC8, FIAS and XML_POS

The Oracle OPERA Hotel Property Interface application (IFC8) is used to connect various onpremise vendor management systems with the Oracle Property Management system. It sends out room and guest data to the vendor system, such as, for example, check-in of guest and check-out of guest. The interface can also receive data (for example, charges or status changes) from the external system to be stored in OPERA using synchronous TCP/IP or serial connection exchanging messages, which are based on either Oracle's universal FIAS API, XML-POS API, or many vendor-based specifications.

Some examples of vendor systems connecting via the Property Interface IFC8 application are the following:

- Telephone Management Systems (TMS) or middleware to TMS systems
- · Door Locking Systems
- HSIA Internet Access Systems
- Point of Sale Systems (Restaurant, SPA, Golf)
- Video Services Systems
- Guest Service systems
- Minibar systems
- Building Management systems
- Miscellaneous / Other systems installed at property

The typical data exchanged via the Property Interface are check-in / check-out notifications (for example, room and guest details, guest rights), charge postings received from vendor systems, make door key requests, wake up requests, credit card payment requests, guest message notifications, room maid status notifications, and many more. This data is exchanged at the time the action occurs in OPERA or on the external system and is usually exchanged without a delay in transmission.

For IFC8 actions exchanged between OPERA Cloud and an external application, the REST APIs utilize multiple ways of connection.

There are inbound actions from the external system that will be exposed through the OHIP REST APIs. Some examples of these inbound actions are sending charges to the guest's room or hotel account, inquiry requests for Guest information by a Point-Of-Sale system, sending room status changes, wake up requests, and guest bill balance requests.

Some outbound IFC8 actions will be exposed using streaming APIs. Some examples include check-in, check-out, room-move notifications, wake-up requests, and guest text messages.

Specific outbound synchronous messages will be exposed using additional outbound service connections from the PMS to the external system. Some examples are door lock key actions (for example, make key and delete key), which require related response messages.

Note:

Key card APIs are currently not available with REST, but will become available in the future.

The below table provides suggested APIs and operations to use when migrating from legacy FIAS/XML-POS IFC8 interface to the REST APIs. There are a few operations currently not available in REST that are available via IFC8.

Note:

Posting charges via room number only (instead of reservationId) is not yet available with REST.

Table 11-4 Suggested APIs and Operations

Sample Messages

Along with the mappings provided with legacy to REST APIs, there are a number of Postman Workflows put together to aid in the development of integrations. The Property Workflow collection navigates and suggests operations to perform for a common workflow. For example, how to perform a check-in or the steps required to search availability and make a new Reservation. There is another collection for Property APIs by Module. This collection has over 2200 sample messages for the operations in each Property API, including Reservation, Blocks, Profiles, and Asynchronous APIs. The collection for Distribution APIs by Module contains sample messages for the Distribution APIs, such as Shop, Book, and Reservation. You can find these collections in gitHub or in Postman.com.

Anti-patterns

An anti-pattern is a software design practice that is ineffective or counterproductive—in other words, the opposite of a "best practice." To put it another way, an anti-pattern is something that the software allows you to do, but that may have an adverse functional or performance impact.

Table 12-1 Anti-patterns

Anti-pattern	Category	Rationale	Recommendation
Using REST APIs to extract bulk data. For example, Folios, Profiles, often specifying a large "limit" query parameter or a large date range.	Functional	Faster access with less operational impact on the hotel	The Oracle Hospitality APIs accommodate many use cases but were not designed for bulk data extract. It is recommended to use either an extract from Oracle Reporting and Analytics for bulk data use cases.
Multi-property shop against property availability API	Functional	Faster access with less operational impact on the hotel	The Oracle Hospitality OPERA APIs are optimized for resort-level resources. While it is possible to shop for availability across many different properties using the Oracle Hospitality OPERA APIs, it is recommended to use the Shop API which is specially designed for this purpose and returns data from a live cache.
			For example, I want to be able to create a reservation for a guest at Hotel1, and then for the same guest book another reservation at Hotel2. The Shop API has the functionality available for you to look at availability across multiple properties.

Table 12-1 (Cont.) Anti-patterns

Anti-pattern	Category	Rationale	Recommendation
Implementing multi- threaded Java application calling streaming API	Technical	Functional and scalable	The Streaming API adheres to the graphql-ws protocol which requires that a given stream receives a connection from only one source to preserve the ordering of events.
			A stream is identified as a combination of the following: gateway + the chainCode + an application key. For an example, refer to the Spring Boot documentation
			Tip: Use a single WebSocketGraphQlClient instance for each server to have a single, shared connection for all requests to that server. Each client instance establishes its own connection, which is typically not the intent for a single server. While we recommend
			using our GraphiQL tool or using Postman to solidify understanding of the Streaming API, it is important to use separate applications for GraphiQL, Postman, and your client code. Similarly, your client code must be single threaded.
			Our recommendation is to use a single-threaded application to consume the stream, then deploy a tool like Apache Kafka and multithreaded clients to consume events from Apache Kafka to populate back end systems.

Table 12-1 (Cont.) Anti-patterns

A satisface and a sure	Ontonom	Detionals	December detien
Anti-pattern	Category	Rationale	Recommendation
Sending a token request with every API call	Functional	More cost effective for partners, protects identity servers Performance impact and operational impact as a result of rate limiting by the identity servers	oAuth tokens have a lifetime of 60 minutes, and requesting an oAuth token is billable to integration partners. Our recommendation is to request a token only once every 59 minutes and implement code that caches and automatically renews the token every 59 minutes and stores it securely. Code that makes API calls can then use the cached token and be assured it is always valid.

Table 12-1 (Cont.) Anti-patterns

Anti-pattern	Category	Rationale	Recommendation
postReservation, putReservation, postProfile and putProfile with invalid codes, such as rate, room type, source and market codes, address type, membershipType, and so on.	Functional	Corrupt data	OPERA Cloud is highly configurable and most of our OPERA Cloud customers leverage this to create the unique experiences offered by their resort. This means that many configuration items will differ from one resort to another.
			When creating or modifying reservations in OPERA Cloud, code valid to the resort must be used in the request body. For example, Market Code or Source Code. Failure to use codes valid for the property will result in reservations being created in OPERA Cloud with invalid codes. As soon as a user views the reservation, the user must update the reservation with valid codes.
			To avoid this, integrators should use the List of Values Management and Enterprise Configuration APIs to determine the configuration particular to the resort they are calling.
			An example is postReservation. When creating a new reservation, there are codes required as part of the request body. Prior to posting the reservation, ensure you have called the List Of Values, such as getSourceCode, getMarketCodes, getGuaranteeCodes, getGuaranteeCodes, getMembershipTypes, and so on. The postman workflow samples we have offer an integrator a suggested set of operations to call prior to posting the new reservation. Please take a

Table 12-1 (Cont.) Anti-patterns

Anti-pattern	Category	Rationale	Recommendation
			look at this to start building your integration.
Writing straight to back end databases after receiving an event	Technical	Overloads back end databases	OPERA Cloud can generate many thousands of events in certain circumstances, and the Streaming API is not throttled. If the streaming client is coded to write straight to a back end database, this can overwhelm the back end database.
			To avoid this, implement a buffering mechanism such that events are consumed from the buffer before being written to the back end database. Ensure that the code reading from the buffer can scale to accommodate large numbers of events without overwhelming the back end database.
Call APIs directly from browsers or mobile apps	Technical	Security of credentials and data	The Oracle Hospitality Integration Platform APIs are certified only to be called from back end systems. This is partly a security posture and partly that the APIs are not optimized for mobile data restrictions. If Oracle Hospitality APIs are needed as part of a browser or mobile app-
			based experience, implement a "Backend for Frontend (BFF)" pattern, which creates an abstraction layer consuming OHIP APIs and provides Experience APIs that are better suited to be called from mobile apps or web browsers.

Table 12-1 (Cont.) Anti-patterns

Anti-pattern	Category	Rationale	Recommendation
Generating implementations tied to API specifications	Technical	Resilience against change	As business APIs, the Oracle Hospitality APIs contain a wealth of data. However, a given integration may need only some of that data. To protect the integration against API changes, it is recommended to implement the "Tolerant Reader" pattern such that consuming code looks only at the fields needed by the implementation. While we always support backwards compatibility for v1 APIs, it is our goal to also support this for v0 APIs. However, changes can occur and the Tolerant Reader pattern can reduce the impact radius of these API changes.
Mapping Experience APIs 1:1 to OHIP APIs	Technical	Chatty, network heavy clients	When writing Experience APIs for consumption by mobile apps or web browsers, the APIs provided by Experience APIs do not need to map 1:1 to Oracle Hospitality APIs. We recommend using "API Composition" to gather all the required information from multiple Oracle Hospitality APIs together with the "Backends for Frontends" pattern to orchestrate multiple OHIP API calls but expose as a single Experience API.

Table 12-1 (Cont.) Anti-patterns

Anti-pattern	Category	Rationale	Recommendation
Sending GET calls to either a collection or single resource repeatedly in case it has changed	Functional	Expensive for integration partners and not real time	Assuming Business Events are configured, every change that occurs within our Hospitality applications triggers a Business Event. Rather than continuously GETting a resource to see if it has changed, we provide the ability to consume Business Events as they occur. For Property APIs, see Business Events.
			For example, my integration requires housekeeping information to be kept in sync with OPERA Cloud. Rather than GETting the data using the HouseKeeping APIs, configure the business events for the housekeeping module. This will ensure events are generated and sent to the external system each time a resource is changed directly in OPERA Cloud. As soon as someone changes a room to Out of Order in OPERA, a business event will be generated for the external system.

Table 12-1 (Cont.) Anti-patterns

Anti-pattern	Category	Rationale	Recommendation
Placing consuming architecture far from the OHIP gateway	Technical	Creates a high latency and poor consumer experience. For the streaming API, this can result in a massive backlog of events that can never be consumed.	When implementing a Backends for Frontends (BFF) against a given OHIP API Gateway instance, verify that high levels of network latency do not exist between these two components. This is because latency can have a negative impact to users of the application connecting to OHIP. For example, fetching an OAuth token should take no longer than 100ms. For ultimate speed and low latency, consider implementing your BFF in the same region as the OHIP API Gateway and housing the OPERA Cloud instance(s) within the Oracle Cloud Infrastructure (OCI). Not only does this reduce latency, but it also increases security because the API traffic remains inside of Oracle Cloud.
Brittle handling of errors	Technical	Incomplete orchestration, unexpected results	Errors tend to be short lived, so to help create a fault tolerant consumer and a safe Backends for Frontends (BFF), use the circuit breaker pattern to retry the same API call when receiving an error. This is particularly important when orchestrating multiple OHIP API calls.

Table 12-1 (Cont.) Anti-patterns

Anti-pattern	Category	Rationale	Recommendation
Specifying all fetch instructions on a resource	Functional	Slow performance	Many of the Oracle Hospitality OPERA Cloud APIs by default return only a subset of a resource or only the parent resource. For example, getProfile returns only the basic information about a person. Many of these APIs use a standard query parameter "fetchInstructions," which allows additional, often child, information on the resource to be returned. By tailoring which additional pieces of information is returned to your use cases, you can increase the performance of and reduce the response body size of your API calls. To achieve this, orchestrate using the "indicators" fetchInstruction that will show which child elements are filled, and then send a call listing only those child elements as fetchInstructions. For example: First call: /crm/v1/ profiles? profilesIds={{profileId}}&f etchInstructions=Indicato rs Then based on the results Second call: /crm/v1/ profiles? {{fprofileId}}&fetchInstru ctions=Communication <a based="" dditional="" fetchinstructions="" of="" results="" td="" the="" the<="" upon="">
			first call>

Table 12-1 (Cont.) Anti-patterns

Anti-pattern	Category	Rationale	Recommendation
Not using the "summaryInfo" query parameter	Functional	Slow performance	If only the summary information of a resource is needed, not child elements, then use the "summaryInfo" query parameter. This will both increase the performance of and reduce the response body size of your API calls. For example: /roomTypes?
			summaryInfo=true
Using Business Events to publish yield updates out to other systems	Functional	Performance impact to OPERA Cloud and to all external systems of that OPERA Cloud	Yield systems supply OPERA Cloud with updated rates to ensure price per room is optimized. This requires sending a large amount of price adjustments, each of which triggers many business events.
			By default, changes made by one external system are not pushed to another external system. The "publisher" feature within OPERA Cloud enables this to be overridden.
			However, the "publisher" feature must not be enabled on external systems in OPERA that supply yield updates because this will flood other external systems with needless rate updates and impact the timeliness of sending unrelated business events to those external systems.

Table 12-1 (Cont.) Anti-patterns

Anti-pattern	Category	Rationale	Recommendation
As a revenue management system, using Synchronous REST APIs to fetch bulk data, or update bulk data.	Functional	Performance impact	Revenue partners should be using asynchronous APIs to perform actions that will take some time for the OPERA Cloud database to action. For example, fetching a year's worth of reservations in OPERA Cloud. The Property APIs have asynchronous operations that cater to these business use cases. For more information, see Business Use Case.
Using APIs beyond their stated scope	Functional	Functional	Ensure you understand the scope of APIs by referencing the API specifications and any Business Use Case articles in the Oracle Hospitality Integration Platform developer portal.

Table 12-1 (Cont.) Anti-patterns

Anti-pattern	Category	Rationale	Recommendation
Enabling business events for an external system in OPERA or in OHIP ahead of being ready to consume	Functional	Causes a large backlog of events, potentially choking the consumer. This can have an operational impact.	As soon as events are subscribed to an external system in OPERA — be it from the OPERA Cloud user interface or OHIP — the subscribed events will start to be enqueued. If not consumed, this will result in a very large queue, which is challenging for consuming systems to process. Further, if the external system sends responses back to OPERA Cloud as a result of events received and is slow to process the events, then operational impact can occur as the state of the data in OPERA Cloud would differ from the state of the data perceived by an external system that is running behind.
			To avoid this, when creating external systems in the OPERA Cloud user interface, configure the Business Events, but mark the external system inactive. Activate the external system only once the consuming architecture is ready. Similarly, subscribe to business events via the streaming API only when the consuming architecture is ready.

Table 12-1 (Cont.) Anti-patterns

Anti-pattern	Category	Rationale	Recommendation
Not staying connected to the streaming API	Functional	Causes a large backlog of events, potentially choking the consumer.	The Streaming API is built upon WebSocket, where the connection remain open. Barring network events, it is expected that WebSocket connections will remain open and connected permanently to the Streaming API, subject to disconnecting every 1 hour to refresh the oAuth token.
			Disconnecting and then reconnecting some time later risks a large backlog of events queuing up, which can be challenging for the consuming architecture to process.
Incorrectly disconnecting from the streaming API	Functional	Connection will not re-open	When disconnecting from the Streaming API, it is important to follow the protocol and send the "Complete" message. After closing this, the connection can be closed. However, consuming systems must wait 500ms before reconnecting.
			Consuming systems that do not follow this process will find the WebSocket does not re-open.
Not sending "ping" to the Streaming API	Functional	Connection closes	To keep the WebSocket connection, the consumer must send a non-billable "ping" every 15 seconds. For more information, see Keeping the Stream Open. If the consumer does not send a ping, then the connection will automatically be closed after 30 seconds.

Table 12-1 (Cont.) Anti-patterns

Anti-pattern	Category	Rationale	Recommendation
Disconnecting then reconnecting from the Streaming API starting from a given offset	Functional	Functional	Each business event sent on the streaming API is given a different offset number. While these appear to increment, a linear progression is not guaranteed. The offset number also changes if the consumer has been disconnected from the stream for over 24 hours. It is recommended to
			remain connected. When you disconnect (for example to obtain a new oAuth token), reconnect without specifying an offset in the subscribe message. OHIP will resume sending events starting from the next event.
Two developers using the same application for streaming API	Functional	Functional	The Streaming API adheres to the graphql-ws protocol which requires that a given stream receives a connection from only one source to preserve the ordering of events.
			A stream is identified as a combination of the following: gateway + the chainCode + an application key.
			If two developers are trying to use the same application to access the Streaming API, they will lock each other out.
			Instead, create one application per developer, then once development is complete, delete those development applications.

Table 12-1 (Cont.) Anti-patterns

Anti-pattern	Category	Rationale	Recommendation
Using any cashierId in payment APIs	Functional	Impairs auditing payments	The cashierId usually represents a person at the front desk, but since it is possible to make payment changes using APIs, it is important to tie back the change to the organization or user who made the change. When multiple organizations use the same cashierId, it hinders auditing payments.
			Contact the environment owner and ask the owner to allocate a cashierId to your organization. Only use this provided cashierId when calling payment APIs.

Accessibility

Accessibility involves making your application usable for differently abled persons such as low vision or blindness, deafness, or other physical limitations. This means creating applications that can be used without a mouse (keyboard only), used with a screen reader for blind or low-vision users, and used without reliance on sound, color, or animation and timing.

Keyboard Only Users

When you log in to the Oracle Hospitality Developer Portal and go to the APIs page, you can use the keyboard keys to bring the focus to the Early Adopter message for Early Adopter APIs.

- 1. On the Early Adopter APIs panel:
 - a. Press the **Tab** key in any of the rows on the APIs page.
 - **b.** Press the **Tab** key and select the highlighted text for the Early Adopter and then press **F6**. The content is highlighted.
 - c. Press the **Tab** key to select the email address in the highlighted text. To send an email, press **Enter**. The selected email address opens in your default email client.
 - d. Press the **Esc** key to let go of the pop-up text.
- 2. To copy an application key using keyboard keys:
 - a. Press the **Tab** key to move to the list of applications while on the Applications page.
 - **b.** Press the **Arrow** keys to move from one application to the next.
 - c. Press **F2** to select an application.
 - d. Press the **Tab** key to select **Copy** or to select **View Details**.
 - e. Press Enter to
 - view the application details while on View Details.

or

- copy the application key to the clipboard while on Copy.
- 3. For users who can view Early Adopter APIs, tab to the early adopter API banner and use the below keyboard commands.

Table 13-1 Keyboard Commands for Early Adopter API Users

Target	Key	Action
Focus within Popup	Tab or Shift + Tab	Navigate the content of the popup. Close the open popup if there are no tab stops in the popup.

Table 13-1 (Cont.) Keyboard Commands for Early Adopter API Users

Target	Key	Action
	F6	Move focus to the launcher for a popup with modeless modality. Close the open popup if the modality is modal.
	Esc	Close the open popup.
Popup Launcher	F6	Move focus to the first tab stop within the open popup. If there is not a tab stop within the content, focus is established on the popup.
Side Filters	Press Tab once	Move focus to side filters.
Search bar	Press Tab again when focus is set on side filters	Move focus from side filters to search bar.
Category	Up and Down Arrows	When focus is set on side filters on any category, you can use the arrow keys to move up or down a category (for example, API Lifecycle, Methods).
Check boxes	F2	Press F2 to move within a category and access the check boxes.

^{4.} Tab to the data visualization chart to navigate between the data points on the Analytics tab.

Table 13-2 Keyboard Commands for Data Visualization Chart

Key	Action
Tab	Move focus to the next element.
Shift + Tab	Move focus to the previous element.
Up Arrow	Move focus and selection to the previous data item.
Down Arrow	Move focus and selection to the next data item.
Left Arrow	Move focus and selection to the previous data item (on left).
Right Arrow	Move focus and selection to the next data item (on right).

Additional Resources

The resources below can help you familiarize yourself with the Oracle Hospitality Integration Platform, existing integrations to OPERA Cloud, hospitality industry terminology, and the application nomenclature associated with the Oracle Hospitality APIs.

15 FAQs

APIs

Do I need to supply the x-hotelid in the header as well as the URL?

Yes, the header parameter is used for authorization where any hotellds in the URL refer to the resource being accessed.

How can I call early adopter (v0) APIs and what are the implications?

See the Early Adopter API Program topic for details.

How long after a v0 API is promoted to v1 will I have to repoint my integration to v1?

Integrations calling v0 APIs have six months during which to point to v1 after a v0 API is promoted to v1. We highly recommend the Tolerant Reader pattern to mitigate this work.

Do I need to request an OAuth each time I make an API call?

No, please avoid doing this. Instead of requesting a token repeatedly, just request a token once per user and keep using that same token for the 1 hour it is valid. Additional calls are unnecessary and may add to your per cost calls.

Billing

If I am using Oracle Hospitality Integration Cloud Service, how do I view my billing and API usage?

View your billing and usage in the Billing Metrics area of the Oracle Cloud Console.

Will all API calls be counted in my API charged usage for Oracle Hospitality Integration **Cloud Service?**

No, 500, 502, 503, and 504 errors will not be charged, and the API calls you make to your own OPERA Cloud nonproduction environment will not be counted or charged as API Cloud usage.

How am I charged for consuming events?

With the streaming API, partners are charged for each event consumed at a rate of \$0.001 per event. When replaying events, partners are charged the first time they replay an event. With the polling API, partners are charged for each API call made at a rate of \$0.001 per API call.

Connecting to a Customer

How can a partner connect to an OPERA Cloud property?

See the Partners Moving to Production topic for details.

How can I verify that an integration user was created correctly?

1. Find the email you received when the hotel approved your integration user. This includes a URL for the Shared Security Domain identity server. Go to this URL.

- 2. Log in using your integration username and password.
- 3. Go to the My Access tab.
- 4. Verify you have the <Tenant>-WSACCESS role.

If you have the WSACCESS role, then the integration user is correctly set up and has been approved by the environment owner.

Eligibility

What are the minimum requirements for a partner to call production OPERA Cloud environments?

1. Your solution must be posted in the Oracle Hospitality Cloud Marketplace (listed under the OHIP product category).

A current Oracle Partner Network Membership (that is, Member Level) is required to post a solution on the Marketplace.

- To join the Oracle Partner Network (OPN), follow the steps here: https:// www.oracle.com/middleeast/partnernetwork/program/join/
- To publish your solution, follow the steps here: https:// cloudmarketplace.oracle.com/marketplace/en US/partnerLandingPage
- Once your application is listed in the marketplace in the OHIP product category, email your listing ID to hgbu_integrations_provisioning_grp@oracle.com and Oracle will grant you access to call production OPERA Cloud Environments.
- **3.** Create a new application by selecting **Production** at step 7 in Registering an Application.
- **4.** Create an integration user within the customer's production tenancy and ensure the customer chain administrator has approved your user.
- **5.** Follow the procedure in Adding an Environment and enter the user name of the integration user.

How can a customer confirm if their subscription is to OPERA Cloud Foundation?

If there is a customer employee at the hotel who is familiar with the hotel's OPERA contract, they can confirm this by reviewing their active subscriptions. Alternatively, the hotel can contact their Account Manager to verify this.

What are the minimum requirements for the streaming API?

For the streaming API, a hotel must be running OPERA Cloud Foundation version 22.3.0.1 or beyond. To get started, customers must engage with Oracle Professional Services.

How do I know if a customer is eligible to use OHIP?

We recommend partners check the following to ensure a smooth production move:

 The customer must be running OPERA Cloud and have an active subscription for OPERA Cloud Foundation.

Note:

OHIP is only available for OPERA Cloud Foundation customers at this point.

Events

How long will OHIP retain events?

When using the streaming API, OHIP retains messages for 7 days; therefore, messages sent in those 7 days can be replayed (see Replaying Messages for more information). Messages not consumed within 7 days are lost and cannot be replayed.

When using the polling API, events are retained forever, but events cannot be replayed via the polling API.

How frequently should I connect to consume events?

It is recommended to keep the WebSocket connected, but depending on use case, this may be neither practical nor needed. However, connecting at least every few days ensures no messages will be lost.

There is no guarantee that a subscription to consume events will remain in place if the application fails to consume the subscribed events for 2 weeks.

What do the terms WebSocket and GraphQL mean?

To learn more, read our blog posts at https://blogs.oracle.com/hospitality/post/ohip-introduces-state-of-the-art-streaming-api-and-rich-analytics and https://blogs.oracle.com/hospitality/post/ohip-streaming-api-understanding-our-strategy.

Is the polling API for fetching business events going away?

No, for some use cases it is the right fit, so it will be available alongside the streaming API.

Can I use the streaming API to fetch ARI (availability, rates, and inventory)?

Yes, but we are working on a more cost effective alternative for ARI.

How many events can I consume at once?

With the polling API, a maximum of 20 events can be retrieved in one API call. The streaming API makes events available as soon as they occur, so there is no maximum number of events.

Will streaming affect throttling?

Only inbound API calls to OPERA Cloud are throttled; events produced from OPERA Cloud are not.

The events tab is not appearing in the application window. What am I missing?

You must have at least one OPERA Cloud environment with streaming enabled added to your Environments tab. You can identify if streaming is enabled for an environment by looking for the Streaming Enabled flag on the environment's card (located under the Environments tab).

Is it possible to clear the backlog of events for my application?

No option is currently available to clear the backlog of events, and you must continue to process those events. Alternatively, you can create a new application and delete the old one if it is not required.

Onboarding

Do we need to sign an agreement to work with OHIP as an integration partner?

No, you must purchase Oracle Hospitality Integration Cloud Service from the Oracle Shop, but there is no further agreement required.

Is there a sandbox provided for testing?

As a customer, we recommend developing and testing in your UAT environment. For more information, see the Quick Start Guide for customers.

Integration partners have complimentary access to a sandbox environment. For more information, see the Quick Start Guide for partners.

OPN and Marketplace

Is a validation or certification needed for OHIP?

A review is optional. By default, OHIP is intended to offer a self-service experience that enables developers to bring their solutions to life without the need for a formal validation. If you would like to request an Oracle Hospitality review, please email hospitality_apis_ww_grp@oracle.com.

How do I add my application to the Cloud Marketplace?

Click the link below and follow the instructions on the page:

https://cloudmarketplace.oracle.com/marketplace/en US/partnerLandingPage

Where can I find information for joining the Oracle Partner Network (OPN)?

To join the Oracle Partner Network (OPN), follow the steps here: https://www.oracle.com/middleeast/partnernetwork/program/join/

Please note that the minimum level required for OHIP is the OPN Member Level.

Appendix A

Web Service Error Codes

Error codes in OPERA Cloud are standardized based on the format Message MODxxxxx. For example, the Reservation module has error RSV00001. Other than the module specific errors, there are generic error codes that apply to all modules. The error code for generic errors is GENxxxxx. For any system generated errors or unhandled exceptions, the detailed error is logged in the application log and the generic error is returned to the web service consumer.

Each web service has a response with the following common pattern:

SuccessType

Each web service response returns an element of Success type to indicate the successful processing of the message. This is used in conjunction with the Warning Type to report any warnings.

WarningType

After a message has been successfully processed to report warnings, this type returns the collection of warnings. Consumers can catch these warnings and take further action.

Multi-record handling operations provide warnings for partial failures. Successfully processed data changes are persisted in the OPERA database.

ErrorType

Returned when the processing of a user's request generates an error. This type returns a collection of the errors, and the web service responds successfully without raising a SOAP fault message.

After handling an error, OPERA Cloud Services never raises a web services fault for business errors or unhandled exceptions. All errors are reported via the "Errors" element.

Customer Relation Management Services (CRM)

Table 16-1 Customer Relation Management Services – Error Codes

Error Code	Error Description
CRM00004	Required data to create a preference is missing
CRM00020	Either Group parameters or Module parameters are required

Table 16-1 (Cont.) Customer Relation Management Services – Error Codes

Error Code	Error Description
CRM00026	Invalid module or search parameters requested for profile activity log
CRM00027	Error creating profile
CRM00028	Name is required when creating a profile
CRM00029	Updating the hotel code is not allowed Using previous value
CRM00030	Updating the preference group is not allowed Using previous value
CRM00031	Unable to find preference {0}
CRM00032	Record is not of type new {0}
CRM00033	Record is not of type modify {0}
CRM00034	Record is not of type remove {0}
CRM00035	Duplicate record found
CRM00036	Membership already exists of type {0}
CRM00037	An inactive membership already exists of type $\{0\}$ with card number $\{1\}$
CRM00038	Failed to process instruction {0}
CRM00039	No City and State found
CRM00040	Ignored invalid preference description for preference type $\{0\}$ and preference $\{1\}$
CRM00041	Invalid user passed to the request
CRM00044	Invalid operation
CRM00045	Membership ID must be specified to do an update and delete
CRM00046	Membership not found
CRM00047	Membership type must be specified
CRM00048	Membership card number must be specified
CRM00049	Membership card number must be specified
CRM00050	Name ID must be specified
CRM00051	Membership card number already exists for this guest
CRM00052	An active membership for type {0} exists for this profile
CRM00053	{2} active card(s) with same card no {1} for membership type {0} exists
CRM00054	Invalid card number
CRM00055	Expiration date must be specified
CRM00056	Member since must be specified
CRM00057	Expiration Date should be greater than Joined Date
CRM00058	Expiration Date should be for month {2}
CRM00059	Membership Level must be specified
CRM00060	Cannot inactivate because future reservations/blocks exists
CRM00061	Unable to fetch Profile Attachments
CRM00062	{0} should not exceed more than {1} characters
CRM00063	Unable to delete membership associated with future reservation
CRM00064	No valid device type attached to membership type

Table 16-1 (Cont.) Customer Relation Management Services – Error Codes

Error Code	Error Description
CRM00065	No membership ID defined for active device
CRM00066	No active device attached to the membership
CRM00067	Device is already attached to another membership
CRM00068	Device already exists as an orphan record
CRM00069	Enrollment code is required
